SMOOTH & QUIET LINEAR MOTION[™]

SIMPLICITY® SELF-LUBRICATING BEARINGS - ISO METRIC

	FM & FMN 8-9 Open & Closed Linear Bearings		SFPM 15 Flange Bearings
	PM & PMN 10-11 Closed & Open Pillow Blocks		DFPM 16 Flange Bearings
	FMT & FG 12-13 Compact Thin Wall Bearings		CFPM 17 Flange Bearings
	PACM 14 Die Set Bushings		

SIMPLICITY® SELF-LUBRICATING BEARINGS - JIS METRIC

	FJH, FJ & FJN 18-19 Open & Closed Linear Bearings		DFPJ 21 Flange Bearings
	SFPJ 20 Flange Bearings		CFPJ 22 Flange Bearings

SIMPLICITY® SELF-LUBRICATING BEARINGS - TECHNICAL INFORMATION

What Makes Simplicity® the Right Choice 24	Vacuums/Outgassing/Clean Rooms 36
What Gives Simplicity these Advantages 25	Classes of Plane Bearings 37
Bearing Liner Material 26	Rating a Plane Bearing 37
Running Clearance 26	Simplicity Maximum Perimeter 37
Bearing Shell 27-28	Formulas for Ratings 37
Self-Alignment Feature 28	PV Equivalents 37
Pillow Blocks 29	Wear Rate VS. Life Expectancy 38
Pillow Blocks - Additional Features 28-29	Coefficient of Friction 39
Load Capacity of Liner 30	Load Capacity (Pressure) 40
Speed Characteristics 30	Linear Surface Speeds (Velocity) 40
Performance Ratings (for Linear Motion) 30	Factors that Contribute to Wear Life 40
Wear Rate/Life Expectancy 31	Types and Effects of Lubrication 40
Factors Affecting Wear Rate/Life 31	Using Oils with Simplicity 41
Transfer Process of Liner to Shaft 32	Grease Products 41
Lubrication 32	Proper use of Greases 41
Temperature 33	Effects of Lubrication 41
Thermal Expansion 33	Application Information 42
Rotary Applications 33	Shaft Deflection 43
Open Bearings Orientation 34	Total Deflection 43
Cantilevered Loads 34	Displacement Angle 43
Severe Misalignment Solutions 35	Installing Simplicity Bearings 44-47
Chemical Resistance 36	Chemical Reaction Chart 48
Submerged Applications 36	

SIMPLICITY® LINEAR SHAFTING - ISO METRIC

	RC60 Steel Shafting 50		Feather Shafting 51
	440 Stainless Steel Shafting 51		Ceramic Coated Aluminum Solid and Pre-Drilled & Tapped Shafting

SIMPLICITY® BALL BEARINGS - ISO METRIC

Simplicity® Self-lubricating Bearings

Miniature Lead Screw - Driven Slides

Linear Motion Systems

Plane Ordering Information

SERIES

- FM - ISO Metric Series
- FMT - Compact ISO Metric Thin Wall Series
- FJ - JIS Standard Series
- PSM - ISO Metric Series Sleeve Bearings
- PSFM - ISO Metric Series Flange Bearings

O.D. Features

- NOTE:** Available ONLY on the "FM, FJ" series
- No Entry** - Standard Straight O.D. bearing
- A** - Crowned "self-aligning" O.D. bearing (closed only)

I.D. Features

- NOTE:** Does NOT apply to "PS, PSF, PSM, PSFM"
- No Entry** - Standard Precision running clearance on the I.D.
- C** - Compensated running clearance on the I.D.

Closed or Open Style

- No Entry** - Standard Closed bearing
- N** - Open series bearing (not available in "FLA")
- NOTE:** Available ONLY on the "FL, FM, FJ" series

Bearing Shell Material

- NOTE:** Available ONLY on "FL, FM, FMT, FG, FJ" series
- No Entry** - Standard Aluminum Alloy
- *S** - 316 Stainless Steel (**NOTE:** No finish plating or anodize available)

Nominal Shaft Diameter

- NOTE:** English units in 16ths of an inch
- Metric units in mm

FM **A** **C** **N** **S** **16** - **D** **E** **JKM** **Q**

Seal Options

- NOTE:** Available only with "FL, FM, FJ" series.
- D** - Double seals of Standard Polymod material
- DU** - Double seals of moly impregnated urethane material
- DV** - Double seals of viton - high temperature material
- NOTE:** Available size FL08-FL32 and FM20-FM80

Bearing Liner Material

- No Entry** - Standard FrelonGOLD® liner for hardened steel shafting and Feather Shafting®
- *E** - Special FrelonJ® liner for soft shafting (aluminum, 300 series stainless steel, etc.)
- *Limited availability may require special quote**

Internal Lubrication

- NOTE:** Available with "FL, FM and FJ" series only.
- No Entry** - Standard bearing - NO lube system
- JKM** - Thru hole, and internal felt wick to help lubrication retention and flow. (**NOTE:** Zerk fitting added to O.D. of PAC & PACM)
- NOTE:** Available for size "FM12 - FM80" only.

Special Modifications

- NOTE:** Consult Factory
- No Entry** - Standard Options
- Q** - Shipped Oil Free (Consult Factory)

CAUTION: The catalog is designed to represent all possibilities, however may not all be standard parts.

*These are options only - combination could lead to unavailable options.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

Simplicity® Plane Bearings

Miniature Lead Screw - Driven Slides

SERIES

NOTE: Standard Simplicity bearings are installed in housings

PM - ISO Metric Pillow Blocks (FM)

PACM - ISO Metric Series Die Set Bushings

SFPM - ISO Metric Series Single Aluminum Flange Mounts

DFPM - ISO Metric Series Double Aluminum Flange Mounts

CFPM - ISO Metric Series Double Aluminum Center Flange Mounts

SFPJ - JIS Metric Series Single Aluminum Flange Mounts

DFPJ - JIS Metric Series Double Aluminum Flange Mounts

CFPJ - JIS Metric Series Double Aluminum Center Flange Mounts

Closed or Open Style

NOTE: Available ONLY on "PM" series

No Entry - Standard Closed Series

N - Open Series

Housing I.D. Features

No Entry - Standard Spherical "self-aligning" I.D. in the housing. (Uses standard straight O.D. bearings)

B - Straight I.D. housing. (For rigid fit use standard bearing. For self-alignment use "FLA" bearings.)

No Entry - Standard Square Flange

R - Available Round Flange

NOTE: Available ONLY on "SFPM, DFPM, CFPM, SFPJ, DFPJ, CFPJ" series

Housings Only

No Entry - Housings with bearing included

E - Empty Housings with NO bearing included

Nominal Shaft Diameter

NOTE: English units in 16ths of an inch
Metric units in mm

Bearing I.D. Features

No Entry - Standard Precision running clearance on the I.D.

C - Compensated running clearance on the I.D.

Seal Options

NOTE: "PAC" and "PACM" available ONLY as "S, SU, or SV"

D - Double seals of Standard Polymod material

DU - Double seals of moly impregnated urethane material

DV - Double seals of viton - high temperature material

Bearing Liner Material

No Entry - Standard FrelonGOLD® liner for hardened steel shafting and Feather Shafting®

E - Special FrelonJ® liner for soft shafting (aluminum, 300 series stainless steel, 440 stainless steel shafting)

Internal Lubrication

No Entry - Standard pillowblock assembly with NO lubrication system

JKM - Thru holes, and internal felt wick to help lubrication retention and flow 1/4-28 Zerk.

Special Modifications

NOTE: Consult Factory

No Entry - Standard Options

Q - Shipped Oil Free (Consult Factory)

CAUTION: The catalog is designed to represent all possibilities, however may not all be standard parts.

*These are options only - combination could lead to unavailable options.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

FM LINEAR BEARINGS

***SELF-ALIGNING O.D. (FMA-XX) STANDARD O.D. (FM-XX)**

*Except for the O.D., bearings with the self-aligning feature have the same dimensions and tolerances as the standard bearing. There is a spherical crown on the O.D. to create the self-aligning feature. They are used in a straight bore housing. Add an "A" to the part number per the example. More information on self-aligning bearings is on pages 41-42.

- NOTES:** (1) Standard pillow block assembly includes self-aligning housing and precision bearing.
 (2) All standard metric pillow blocks use standard "FM" series bearings found on page 18.
 (3) Straight bore pillow block assembly includes standard O.D. "FM" series bearing in straight bore housing.

NOTES: Formula used for effective surface area is $(\pi * ID * L)/3$
 Max static load is effective surface area times max load for FrelonGOLD®
 - 210 kgf/cm² is the rating for FrelonGOLD®
 - 105.45 kgf/cm² is the rating for FrelonJ®

NOTE: DIMENSION FOR CALCULATING BOLT CIRCLE

$$J = C + 15.8\text{mm}$$

FOR M8 X 1.25 SCREW

4 PAC CLAMPS ARE SHIPPED WITH EACH DIESET

EXTRAS CAN BE ORDERED USING PART #: PACCLAMP

Simplicity® Self-lubricating Bearings

Linear Bearings - JIS Metric

Linear Motion Systems

FJ LINEAR BEARINGS

*SELF-ALIGNING O.D. (FJA-XX)

STANDARD O.D. (FJ-XX)

*Except for the O.D. bearings with the self-aligning feature have the same dimensions and tolerances as the standard bearing. There is a spherical crown on the O.D. to create the self-aligning feature. They are for use in a straight bore housing. Add an "A" to the part number per the example. More information on self-aligning bearings is on page 41-42.

Flange Bearings

Simplicity® Self-lubricating Bearings

What Makes Simplicity the Right Choice?

Linear Motion Systems

Technical Information

Plane bearing applications represent 25% of total worldwide bearing usage.

Why? Good engineering principles dictate the best bearing design for the application. Often ball bearings are asked to perform beyond their design capabilities. The rolling element industry has not helped users understand the limitations of their technology.

In 1983, linear ball bearing users came to Pacific Bearing® and asked for a linear bearing that simply would not fail. Dirt, vibration, shock loading, water washdowns, etc. were causing premature failure, often within days. After testing many material combinations, we chose the Simplicity design as the best solution.

In 1997, three years of rigorous development and testing resulted in the release of the next generation of plane bearing material – FrelonGOLD®. The original Simplicity bearings were improved with additional performance advantages. These are the advantages you will gain with Simplicity:

LINER

- Self-lubricating – requires no external lubricant
- Embeddability of hard particulate eliminates galling and shaft damage
- Dampens vibration for quiet and smooth operation

LOAD CAPACITY

- FrelonGOLD® supplies an average of 20x more load capacity than a standard linear ball bearing allowing the Design Engineer to use a more compact package
- Shock loads are absorbed without damage to components

PERFORMANCE

- Simultaneous linear, oscillating, and rotary motions expand possibilities
- Reliable friction characteristics that do not increase over the life of the bearing
- Liner material similar to energized Teflon® seals
- Close fit & wiping action - cleans shafting - eliminating the need for seals

LOW COST

- Average purchase price 15-30% less than rolling element linear bearings
- Operates maintenance free
- Reliable, predictable life
- WILL NOT CATASTROPHICALLY FAIL!!

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

Simplicity® Self-lubricating Bearings

What Gives Simplicity these Advantages?

Linear Motion Systems

Technical Information

THE FRELON® BEARING LINER MATERIALS

FrelonGOLD® and FrelonJ® are a compound of Teflon® and fillers developed for improved performance over other bearings. They provide low wear, low friction, self-lubrication, and high strength.

TEFLON FEATURES:

- Self-lubricating (runs without added lubricant)
- Embeddability of hard particulate
- Wide temperature range (-400°F/+400°F)
(-240°C/+240°C)
- Chemically inert
- Vibration dampening (NO metal-to-metal contact)

FILLER BENEFITS:

- High load capacity
- High strength
- Low wear rate vs. other materials

PACIFIC BEARING HAS COMBINED FRELON® WITH PRECISION BEARING TECHNOLOGY TO CREATE SIMPLICITY®

- The Frelon liner is bonded to the bearing shell at the molecular level, which transfers the load and dissipates heat buildup throughout the bearing
- Will not rust or corrode due to anodized aluminum or stainless steel shell
- Patented self-aligning capabilities are standard (See pages 41-42 for information)
- Provides both linear, oscillating, rotary, or any combination of motions
- Maintenance free operation
- Will not damage shafting
- Smooth, quiet operation
- Highly accurate – all critical surfaces are ground on precision bearing grinders
- WILL NOT CATASTROPHICALLY FAIL!

Teflon® is a registered trademark of Dupont Corporation

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

FrelonGOLD®

FrelonJ®

Bearing Plug Shown - See Page 33.

BEARING LINER MATERIAL

Simplicity bearings are available with three liner materials.

FrelonGOLD is a dark gold colored high performance material with gold-colored fillers and is compatible with standard RC60 hardened steel shafting, RC70 ceramic coated Feather Shafting™ and 440 stainless steel shafting.

Frelon J is a yellow colored material specially formulated to provide the optimum performance with 300 series stainless steel and softer shafting like bare aluminum.

RUNNING CLEARANCE

Simplicity bearings are available with two classes of running clearance.

PRECISION-“FL”:

- Performs like a preloaded ball bearing
- Tightest running clearance approximately .001" (.025mm)
- Use in applications that require high precision

CAUTION: Not recommended for all parallel shaft applications. Any misalignment can cause binding on the shaft. See recommended “FLC”.

COMPENSATED-“FLC”:

- Performs like a standard ball bearing
- Additional clearance built into the I.D. (all other dimensions are the same as the precision bearings)
- Ideally suited for parallel shaft applications

NOTE: Many parallel shaft applications will run “FL” precision on one rail and “FLC” compensation on the opposite rail to accommodate slight misalignments.

BEARING SHELL

Simplicity bearings are available in a variety of configurations to help meet specific application needs.

- Standard is aluminum alloy with anodized finish (standard)
- Special 316 stainless steel (no plating) (optional)

RUNNING CLEARANCE

Standard “FL”
Performs like a preloaded linear ball bearing

.0005" per side clearance average
(.0127 mm)

Compensated “FLC”
Performs like a standard linear ball bearing

.0015" + per side clearance average
(.0381 + mm)

STANDARD

Inch Series

ISO Metric Series

JIS Metric Series

OPTIONAL

316 Stainless Steel

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

BEARING SHELL (cont.)

MATERIALS:

Aluminum Alloy – Is a heat treated and artificially aged aluminum with good strength and corrosion resistance.

316 Stainless Steel – Has an excellent corrosion resistance and is widely used by the paper, food, and other industries.

FINISHES:

Standard Anodized – A sulfuric bath anodizing with a nickel acetate seal that will stand up to 14 days exposure in a 5% salt spray solution at 96°F. It is applied at a .0002" thickness.

NOTE: See page 62 for details on chemical resistance.

TOLERANCES:

- All bearings are precision ground both I.D. and O.D. to provide the highest quality.
- Statistical Process Control (SPC) capabilities also increase final quality.

SELF-ALIGNMENT FEATURE

Simplicity bearings are available with a standard straight O.D. or a crowned self-aligning O.D.

“FL” – (Standard):

- Straight O.D.
- Pacific Bearing standard pillow blocks have the self-aligning capability designed into the block using standard “FL” bearings for the final assembly

“FLA” – (Self-aligning O.D.):

- Has a crown on the O.D. allowing the bearing to re-align itself in binding situations
- Specifically designed to easily retrofit straight bore housings
- The bearing will allow 1/2° of misalignment capability from centerline (1° overall).
- O-rings are used on either side of the crown. This cushions and eliminates clatter in operation.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing’s only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

PILLOW BLOCKS

- Made of aluminum alloy
- Pillow blocks are interchangeable with industry standard ball bearing pillow blocks
- Critical centerline dimensions hold accuracy within $\pm .001''$ on inch sizes and $\pm .015 \text{ mm}$ on metric sizes

FINISHES:

- Clear anodized finish (Standard)

Standard pillow blocks have built-in self-alignment in all directions.

- Standard pillow blocks have $1/2^\circ$ misalignment from centerline.
- This feature is built into the housing with a patented spherical radius at the midpoint of the block.
- This self-aligning capability will allow for some shaft deflection and misalignment.

Rigid or straight bore housings are available.

- This does not allow for any self-alignment and provides a very rigid assembly.
- They are typically used in single shaft applications.

ADDITIONAL FEATURES

O-Rings – Used in standard pillow blocks and with self-aligning bearings.

Nitrile Buna 70 (standard) – A good general purpose rubber that is used in 98% of applications.
-65°F to 275°F (-50°C to 135°C)

Viton (special – designate with “V”) – Used only in high temperature applications up to 400°F (up to 204°C).

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

PILLOW BLOCKS - ADDITIONAL FEATURES (cont.)

SEALS: Use only in the most contaminated environments.

Polymod® (standard) – A high performance polymer modified material that reduces friction of a standard buna material by 50% and increases wear life

®Polymod is a registered trademark of Polymod Technologies, Inc.

Temperature – -40 – +400°F

Urethane (special - designate with “U”) – A moly-impregnated urethane scraper that is only for the severest applications - friction is greatly increased!

Temperature – -40 – +180°F

Viton™ (special - designate with “V”) – Used only in high temperature applications up to 400°F (up to 204°C).

ATTENTION: 90% of applications do not require seals when using Simplicity bearings. The liner has a natural ability to wipe particles from the shafting. Any particulate (metal, sand, etc.) that does enter the bearing will embed itself into the soft liner not scoring the shafting or locking mechanical parts.

LUBRICATION SYSTEM: Order with “JKM” modifier

- Recommended for high speed, high load, and rotary or oscillating applications

Lubrication System consists of:

Felt wick – Retains oil lubricants (remove when using grease lubrication)

Zerk fitting – Installed into pillow block, other housing, or directly into die sets PAC, PACM

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

LOAD CAPACITY OF LINER

Simplicity bearings can carry from 4 to 20 times the load of a linear ball bearing.

BEARING MATERIAL	STATIC LOAD CAPACITY
FrelonGOLD®	20.68 N/mm ²
FrelonJ®	10.34 N/mm ²

- Allows the engineer to maintain performance in a smaller designed package

Example: Simplicity 1/2" I.D. = 1" I.D. linear ball bearing

- Shock loads and vibration are absorbed
- Metal to metal contact is eliminated providing a smoother, quieter running assembly

SPEED CHARACTERISTICS

Exceeding these speeds causes frictional heat and accelerates liner wear.

BEARING MATERIAL	NO LUBE CONTINUOUS MOTION	NO LUBE INTERMITTENT MOTION	WITH LUBRICATION*
FrelonGOLD	300 sfm	825 sfm	825 sfm
	60 in./sec.	165 in./sec.	165 in./sec.
	1.524 m/sec.	4.19m/sec.	4.19 m/sec.
FrelonJ	140 sfm	400 sfm	400 sfm
	28 in./sec.	80 in./sec.	80 in./sec.
	.711 m/sec.	2.03 m/sec.	2.03 m/sec.

*Depending on the lubrication used, loads, and frequency of continuous or intermittent motion, speeds can be in excess of the numbers shown.

PERFORMANCE RATINGS (for Linear Motion)

Plane bearings are rated by their limiting PV which is a combination of load over a given surface area and the velocity.

BEARING MATERIAL	MAX. "PV"	MAX. "P"	MAX. "V" (NO LUBRICATION)
FrelonGOLD	20,000 (psi) x ft./min.)	3000 psi	300 sfm
	430 (kgf/cm ² x m/min.)		
FrelonJ	10,000 (psi x ft./min.)	1500 psi	140 sfm
	215 (kgf/cm ² x m/min.)		

PV = The performance measurement of plane bearings

PV = P x V where P = pressure (load) in psi (kgf/cm²)

V = velocity (speed) in sfm (m/min.)

NOTE: All 3 parameters must be met by an application for the bearing to perform properly.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

WEAR RATE/LIFE EXPECTANCY

The life expectancy of a Simplicity bearing is dependent on application parameters.

Factors that will affect life...

- Shaft hardness, surface finish, and preparation
- Length of travel • Temperature
- Contamination • Running clearance
- Lubrication • Speed
- And many, many other factors

The Radial Wear chart gives a guideline for a typical application at 10 psi (.703 kgf/cm²) traveling at 100 ft./min. (30.48 m/min.).

FACTORS AFFECTING WEAR RATE/LIFE

Shafting requirements for Frelon® bearing materials.

BEST PERFORMANCE:

- Finish of 8 - 12 RMS
- Hardness of RC60

ACCEPTABLE PERFORMANCE:

- Finish of 8 - 16 RMS
- Hardness of RC35
- Surface finish requirements apply to all three Frelon bearing materials.
- Rougher shafting can be used, but both bearing and shafting will wear at accelerated rates and binding may occur.

NOTE: Consult factory if using chrome plated shafting.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

FRELON® TRANSFER PROCESS

NOTE: At break-in, Frelon deposits a microscopic film on the shaft and fills the valleys in the surface finish creating a Frelon-on-Frelon running condition that is true self-lubrication.

RECOMMENDED LUBRICATION

- Waylube Oil
- Light Weight Oils
- Petroleum Based Grease
- 3-in-1 oils

NOT RECOMMENDED

- WD-40
- PTFE Sprays
- Fluorocarbons
- Silicon Oils, Grease or Spray

WD40® is a registered trademark of the WD40 company

TRANSFER PROCESS OF LINER TO SHAFT

The interaction of the Frelon® material and the shafting creates a natural, microscopic transfer of the Frelon to the running surface. A thin film is deposited on the shaft, and the valleys in the surface finish are filled in with Frelon material during the initial break-in period. This transfer creates the self-lubricating condition of Frelon riding on Frelon.

This break-in period will vary depending on several criteria:

1. Preparation of the shafting prior to installation - it is best to clean the shafting with a 3-in-1 type oil before installing the bearings. This ensures that the surface will receive a full transfer of material.
2. Speed, load, and length of stroke specific to the application - typically the initial transfer process will take approximately 50-100 strokes of continuous operation. The running clearance on the bearing will increase an average of .0002" to .0005", depending on the length of the stroke and surface requiring the transfer.
3. How often the shafting is cleaned - if the shafting is cleaned regularly, increased wear will be seen in the bearings. This is due to the transfer process being performed over and over again.

CAUTION: Do not repeatedly clean the shafting with alcohol! This will remove the previously transferred material entirely and increase the wear to the bearing liner.

LUBRICATION

Lubrication can...

- Reduce friction up to 50%.
- Minimize wear of liner.
- Reduce heat buildup allowing greater speeds. Actual speeds achieved are dependent on type of lubricant and frequency of application.
- Aid in cleaning the shafting for a proper transfer process. A minimum of initial lubrication of Simplicity bearings is strongly recommended.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

TEMPERATURE

Simplicity bearings can operate in a wide range of temperatures (-400°F/+400°F) (-240°C /+240°C). Temperature dependent on materials housed in pillow block and size of bearing.

- Maintains the same performance characteristics
- The thin liner allows heat to dissipate through the bearing shell

THERMAL EXPANSION

The standard bearing ID options are designed for use in most industrial applications.

For temperatures below 0° F, the standard I.D. is recommended. (FL series)

For extreme high temperatures, the Compensated I.D. bearing is recommended (FLC) for the increased running clearance.

CAUTION: It is always best to inspect actual size at extreme temperatures to insure proper running clearance.

ROTARY APPLICATIONS

Simplicity bearings will operate very well in rotary applications if applied properly.

Stationary rotary applications do not allow the heat to be spread over an extended area. It is retained in the I.D. of the bearing limiting speed and load.

- MAX Rotary Speed (No lube/continuous motion)
- 40 sfm (12.2 m/min.) for standard precision ID clearances
- 140 sfm (42.6 m/min.) for compensated ID clearances

$$V(\text{sfm}) = .262 \times d \times \text{RPM}$$

d = shaft diameter (inches)

RPM = revolutions per minute

- Properly maintained lubrication can increase these speeds dramatically.

CAUTION: It is always best to do specific testing for rotary applications above these limits where lubrication is to be used.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

OPEN BEARINGS ORIENTATION

Simplicity bearings can operate in any orientation.

Load capacities will vary on open bearings depending on the orientation in which they are being used.

CANTILEVERED LOADS

- Maximum 2:1 ratio
- 1x = bearing separation on same shaft
- 2x = distance from shaft to load or force

EXAMPLE: If 2x equals 10" then 1x must be at least 5"

CAUTION: BINDING will occur if the 2:1 ratio is exceeded!

This principle is NOT load dependent! It is also NOT dependent on the driving force used! The bearings will bind whether hand or mechanically driven.

This principle is a product of friction.

What if more than 2:1 is required?

Often times holding the 2:1 ratio is not possible. One method of preventing binding problems in these cases is to use a counter balance.

For efficient counter balances, use this formula:

$$M * Y = W * Z$$

NOTES: To avoid problems when running without mass (M) $Z = 1.5X$

W can be calculated; load on bearing will be:

$$\frac{M + W}{\# \text{ of bearings}}$$

EXAMPLE: $50 * 24 = W * Z$ ($Z = 1.5 * 6 = 9$)

$$W = \frac{50 * 24}{9} = 133 \text{ lbs.}$$

$$\text{Load per bearing} = \frac{50 + 133}{4} = 45.75 \text{ lbs./bearing}$$

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

SEVERE MISALIGNMENT SOLUTIONS

Linear ball bearings will continue to operate in a misaligned condition, but will cause damage to shafting and catastrophically fail.

Simplicity bearings DO NOT tolerate misalignment. They simply will stop moving without any damage to the shafting.

Self-aligning housings will aid in misalignment - up to $1/2^\circ$ from centerline.

POSSIBLE SOLUTIONS for use with Standard "FL":

Undersize the bearing O.D. (see chart) and install o-rings. See product pages for o-ring numbers.

Oversize the housing I.D. (see chart) and install the standard bearing with o-rings. See product pages for o-ring part numbers.

The additional clearance created by either method will allow the bearing to float in the housing and match the non-parallelism of the shafting.

CAUTION: This solution is only for SEVERE cases that the standard self-aligning will not accommodate.

NOTE: Maximum additional clearance and o-ring information for severe misalignment solutions on page 61. For complete installation instructions, see pages 58-61 in the Technical Section.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

CHEMICAL RESISTANCE

Simplicity bearings stand up to harsh environments.

FrelonJ® – almost universal chemical inertness. Only molten sodium and flourine at elevated temperatures and pressures show any signs of attack.

FrelonGOLD® – the fillers in the material can be attacked by deionized water and other harsh chemicals.

Anodized Aluminum Shell (Standard) – good chemical resistance in most industrial applications.

316 Stainless Steel Shell (Optional) – excellent chemical and corrosion resistance in harsh environments. (See page 62 for complete chemical interaction listing.)

SUBMERGED APPLICATIONS

Simplicity bearings will provide excellent performance in a submerged condition.

The bearings will employ the fluid as a lubricant showing increased velocities and wear life. Oils and non-salt water are especially effective.

Do not use FrelonGOLD® in submerged applications, however FrelonGOLD® is suitable for washdowns.

VACUUMS/OUTGASSING/CLEAN ROOMS

Due to self-lubrication, low outgassing, and a minimum of particulate (buildup), Simplicity bearings are excellent in clean rooms and vacuums.

Testing has been done on the Frelon® materials in accordance with ASTM E-595-90 with acceptable maximums of 1.00% TML and .10% CVCM.

MATERIAL	% TML	% CVCM
Frelon	0.00	0.00
FrelonJ	0.18	0.01

TML = Total Mass Loss

CVCM = Collected Volatile Condensable Materials

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

CLASSES OF PLANE BEARINGS

Simplicity bearings are in a class of bearings known as plane bearings, which means that they have no rolling elements. There are three classes of plane bearings:

Class I - Require an outside source of lubrication (oil, grease, etc.).

Class II - Lubrication is impregnated within the walls of the bearing. (Bronze, powder metal, etc.) Typically these bearings require an added lubricant also.

Class III - Self-lubricating bearings, which do not require added lubricants.

Simplicity bearings are Class III plane bearings and are self-lubricating.

RATING A PLANE BEARING

Plane bearing performance capacity is rated by PV.

P - pressure or load in pounds per square inch (psi) or kilograms per square centimeter (kg/cm²).

V - velocity or surface speed in feet per minute (fpm or sfm) or meters per minute (m/min.).

PV - pressure velocity value.

SIMPLICITY MAXIMUM PERIMETER

MAXIMUM PARAMETERS	P	V (RUNNING DRY)	PV
FrelonJ®	1500 psi or 105.45 kgf/cm ²	140 sfm or 42.67 m/min.	10,000 psi x ft./min. or 215 kgf/cm ² x m/min.
FrelonGOLD®	3000 psi or 210.9 kgf/cm ²	300 sfm or 91.44 m/min.	20,000 psi x ft./min. or 430 kgf/cm ² x m/min.

NOTE: All three parameters must be met in order for the bearing to operate properly.

FORMULAS FOR RATINGS

PRESSURE IS OVER THE PROJECTED AREA OF LOAD:

$$A = L \times d$$

$$P = \frac{W}{A} \text{ psi (or kg/cm}^2\text{)}$$

VELOCITY:

Linear = total distance traveled in one minute

ROTATIONAL VELOCITY:

$$V = \frac{\pi \times d \times n}{12} \text{ fpm (or m/min.)}$$

PRESSURE VELOCITY VALUE (PV):

$$PV = P \times V \text{ psi x fpm (or kg/cm}^2 \text{ x m/min.)}$$

PV EQUIVALENTS

	INCH	TECHNICAL METRIC	INT'L METRIC (SI)
LOAD	1 psi	.0703 kgf/cm ²	.0069 N/mm ²
VELOCITY	1 ft./min.	.3048 m/min.	.00508 m/sec.
PV	1 PV	.0214 PV	.000036 PV
FrelonJ® MAX PV	10,000	215	.36
FrelonGOLD® MAX PV	20,000	430	.72

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

WEAR RATE VS. LIFE EXPECTANCY

A rolling element linear bearing's life expectancy is usually expressed in total inches or meters. A rolling element rotary bearing's life expectancy is expressed in hours of operation. Both are also rated for average (L-50) and minimum (L-10) life. L-50 life is the average life that can be expected from 50% of rolling element bearings. In other words, 50% will not reach the average life expectancy. L-10 life is the minimum life (1/5 the average life) expected from 90% of rolling element bearings. In other words, 10% will not reach the minimum life expectancy. Theoretically they could fail upon installation.

Plane bearings are not rated by a life expectancy but by the wear rate of the bearing material. Wear is greatly dependent

upon the proper application of the bearing and material used. If it is not properly applied, it will fail. Failure, however, is subjective and dependent upon specific application requirements. 0.002" running clearance may not be acceptable in one application while another may be able to run a bearing until the liner is completely worn through. The user may then rotate it 30 degrees and continue to run it. This broad range of acceptability makes it difficult to determine life expectancy.

The first step is to determine what wear is acceptable for your application. Then utilizing the test data below, you can estimate the wear expected for your given application.

CONDUCTED BY: Pacific Bearing® Company

BEARING MATERIAL: FrelonGOLD®

SHAFT MATERIAL: Standard RC60 steel shafting

SURFACE FINISH: 8-12 RMS

SPEED: 140 fpm (70 cycles/min; 1,680"/min; 100,800"/hour; 2,419,200"/day)

STROKE: 12"

LOAD: 10.87 psi (53 lbs.)

BEARINGS USED: FLN12 (3/4" open style bearings)

LUBRICATION: None

TOTAL WEAR TO BEARING MATERIAL:
FrelonGOLD® = .00042"

NOTE: Wear is an average of totals taken from 4 bearings per carriage.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

COEFFICIENT OF FRICTION

A frequent misconception of plane bearings is that wear and friction are basically synonymous, in that, high friction equals high wear or that low friction equals low wear. While there can be a relation between the two, they should be addressed as separate issues in the design process.

For example, dry running virgin (unfilled) Teflon® on steel's coefficient of friction (c.o.f.) is approximately .1 while filled Teflon's c.o.f. can range from .125 to .4 depending on the fillers used. By comparison, however, the virgin Teflon will wear at a much greater rate.

FRICION TEST SAMPLE #1

CONDUCTED BY: Dr. Tillwich GmbH

MANAGING DIRECTOR: Mr. Werner Stehr (World leading tribologist with a seat on the ISOTC123 Committee establishing standards for tribological testing.)

BEARING MATERIAL: FrelonGOLD®

SHAFT MATERIAL: Standard RC60 steel shafting

SURFACE FINISH: 8-12 RMS

SPEED: 50 mm/sec

LOAD: 6 N

TEMP.: 25° C

LUBRICATION: None

AVG. COEFFICIENT OF FRICTION:
 FrelonGOLD® = .125

FRICION TEST SAMPLE #2

CONDUCTED BY: FrelonGOLD® material processor

BEARING MATERIAL: FrelonGOLD®

SHAFT MATERIAL: CRS 1018

SPEED: 100 fpm

LOAD: 100 psi

DURATION: 25.68 hours

LUBRICATION: None

SURFACE FINISH: 8 RMS

AVERAGE COF: 0.10

MAX. COF: 0.15

MIN. COF: 0.08

AVG. RUNNING TEMP.: 95.40° F

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

LOAD CAPACITY (Pressure)

Depending upon the material used, a plane bearing's load capacity can greatly exceed a rolling element bearing. There are three basic reasons for this:

1. The area of surface contact with the shaft is far greater than rolling element bearings, which have point-to-point contact with a given number of balls.
2. A rolling element bearing must be oriented properly for the ball tracks to carry the load adequately, while a plane bearing can be mounted in any orientation.
3. Only one or two of the tracks in a rolling element bearing will actually carry any of the load applied.

Simplicity bearings have a thin liner that is bonded to a metal shell at the molecular level, allowing the load to be transferred throughout the bearing. This gives it an advantage over other plane bearings of solid plastic or polymer materials. These other materials will tend to "cold flow" under pressure. "Cold flow" means to deform or lose shape. The idea is similar to pressing your finger into a bar of soap - material will move or deform as pressure is applied.

LINEAR SURFACE SPEEDS (Velocity)

In typical applications, speed is a known quantity and easily converted. Typically feet per minute or meters per minute are used. The most important factor that speed (along with friction) produces is heat buildup. This is not a critical factor in most linear applications because the heat is dissipated over the length of travel, and it does not affect the bearing. Short stroke or extremely high speed applications may see the effects of heat buildup in thermal expansion and the bearing ID locking on the shaft. A compensated ID bearing (FLC) is recommended in these applications.

FACTORS THAT CONTRIBUTE TO WEAR LIFE

Proper mating of shaft and liner materials.

Surface finish 8-16 RMS (.20-.40mm) is required. Peaks in the surface that are polished to a radius provide the best running surface. Sharp peaks in the finish will be like a fine lapping compound wearing the I.D. of the bearing.

NOTE: Shafting damaged by use with ball bearings can be salvaged and used with Simplicity bearings. Spin in a lathe and polish with sand papers in this order: 120 grit, 180 grit, and 300 grit. This will also remove sharp peaks in the surface finish.

Surface speed - at high speeds, heat buildup will affect liner wear.

Break-in transfer - proper transfer process of the liner to the shaft. (pg. 46)

Lubrication - proper lubrication can greatly improve the wear rate of a bearing. At the same time, improper lubrication can increase wear and failure.

Load & Wear Relationship - Wear is proportional to $(load)^3$, so if load is reduced to $1/2$, wear will be reduced to $(1/2)^3$.

Contamination - while migrating into the bearing and embedding into the liner, certain types of contamination may, over time, cause increased wear to the liner.

NOTE: This is not an all inclusive list. There are many, many more factors within an application that can affect wear to different degrees. These are the major issues and the first things to address in a design.

TYPES AND EFFECTS OF LUBRICATION

Lubrication is any outside technique used for reducing the friction, wear, or both of a bearing. **Proper lubrication of Simplicity bearings is critical.** Evaluate lubrication needs on an application by application basis to determine whether or not it should be used at all, what type is needed, and how it is applied. Below are some criteria on which to base the lubricant decision:

DO NOT USE WD40™, PTFE sprays, or other oils, greases, or sprays that contain fluorocarbons or silicone. In testing, these lubricants have proven to cause long-term stick-slip problems with the Frelon lined bearings. They tend to become a gummy substance that ultimately increases friction.

RECOMMENDED LUBRICANTS:

- Waylube oils
- Lightweight oils
- 3-in-1 type oils
- Lightweight petroleum based greases

WD40™ is a registered trademark of the WD40 Corporation.

USING OILS WITH SIMPLICITY

DO NOT USE ANY TYPE OF MOTOR OIL OR OILS WITH ADDITIVES! These types of oils work well short term, but quickly become ineffective, and will cause stick-slip reactions in the bearing. As a rule of thumb, the less additives in the oil, the better the performance. Recommended oils are Mobil Vactra #2 (a way lube oil) and any standard 3-in-1 oil. The 3-in-1 oils are tremendous cleaning oils and are the best in preparing for a proper transfer of teflon to the shafting.

GREASE PRODUCTS

DO NOT USE A MOLY FILLED OR OTHER TYPE FILLED GREASES! They become like a lapping compound on the ID of the bearing and increase wear dramatically.

PROPER USE OF GREASES

Proper use of grease is critical for trouble-free operation.

Be sure the felt wick is removed from a “FL-xx-JKM” bearing because grease inserted through the zerk will cause the wick to act like a brake.

Do not fill all of the running clearance with grease! The temptation is to treat it like a rolling element bearing and fill it until it weeps from the end. This will cause greater friction and binding.

The rule of thumb for the bearing liner that “thin is better” applies to the use of grease also.

If grease is used and does not work in the application, it is possible to salvage the bearing with minimal work and to continue to operate. Follow the steps below:

1. If possible, remove the bearing from the housing, wipe the grease from the liner, use a 3-in-1 type oil to clean the excess remaining grease, and reinstall.
2. If it is not possible to remove the bearing, wipe as much grease as possible away from the ends of the bearing, then start to fill with a 3-in-1 type oil for cleaning the liner. To speed the cleaning process, apply forced air to the bearing through the zerk hole and continue using oil lubrication.

EFFECTS OF LUBRICATION

Lubrication can greatly increase the performance of a bearing when applied properly as noted earlier. Actual performance results for specific applications are difficult to predict due to the number of elements involved (temperature change with lube, useable life or aging of lubricant, etc.). Specific application testing is recommended to establish specific performance parameters. Below are charts with guidelines of performances.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

SHAFT DEFLECTION

In applications where a support rail is not used, shaft deflection can become critical in the function of the bearing. If deflection is greater than the misalignment capabilities of a standard pillow block, binding can occur. Solutions would be to increase shaft and bearing size (to lessen the amount of deflection) or to use an open bearing configuration with a support rail. Follow the formulas below to check shaft deflection and sag.

FORMULA FOR INCH AND METRIC SHAFTING DEFLECTION

Total shaft deflection in horizontal applications:

$$\text{Tot. Def} = \text{Def} + \text{Sag}$$

$$\text{Def} = w \times L^3 / D$$

$$\text{Sag} = L^4 / S$$

Def = Pure deflection due to load at center of shaft (inches or mm)

Sag = Deflection of shaft due to its own weight (inches or mm)

L = Shaft unsupported length (inches or mm)

w = load being applied at center of shaft (lbs. or N)

D = Deflection coefficient (D = 48 x E x I)

S = Sag coefficient (S = E x I x 384 / (5 x sw))

NOTES: I = $\pi \times \text{diam}^4 / 64$

sw = $\pi \times \text{diam}^2 / 4 \times \text{density}$

E = Modulus of Elasticity (Young's modulus)

TOTAL DEFLECTION

ø1 in. Shaft

24 in. Length (L)

250 lbs. load (W)

$$\begin{aligned} \text{Deflection} &= \frac{W \times L^3}{D \text{ (from table)}} \\ &= \frac{250 \text{ lbs.} \times (24 \text{ in.})^3}{6.83 \times 10^7} \\ &= \frac{3,456,000 \text{ in.}^3 \text{ lbs.}}{68,300,000 \text{ in.}^2 \text{ lbs.}} \end{aligned}$$

$$\text{Deflection} = 0.0506 \text{ in.}$$

$$\begin{aligned} \text{SAG} &= \frac{L^4}{S \text{ (from table)}} \\ &= \frac{(24)^4}{4.92 \times 10^8} \end{aligned}$$

$$\text{SAG} = \frac{331,776 \text{ in.}^4}{492,000,000 \text{ in.}^3}$$

$$\text{SAG} = .000674 \text{ in.}$$

$$\begin{aligned} \text{Total Deflection} &= \text{Deflection} + \text{SAG} \\ &= 0.0506 \text{ in.} + .000674 \text{ in.} \end{aligned}$$

$$\text{Total Deflection} = 0.0513 \text{ in.}$$

DISPLACEMENT ANGLE

INSTALLING SIMPLICITY® BEARINGS

Applies to standard linear bearing series.

For sleeve and flange bearings, see product pages in the catalog.

PS - Page 154, PSM - Page 156, PSF - Page 155, PSFM - Page 157

STRAIGHT BORE HOUSING - PRESS FIT BEARING

This type of configuration is NOT recommended for the vast majority of applications using Simplicity bearings.

It does NOT allow for any misalignment or shaft deflection.

Misalignment or shaft deflection will cause the bearing to bind on the shafting.

Extremely high precision applications may be able to employ this type of mounting. Typically the shafting has been aligned with a laser or some other highly precise equipment.

Due to bore closure in the pressing process, use a "C" series (compensated I.D.) bearing.

EXAMPLE: FLC24, FMC30, FJC30

The recommended installation procedure is to freeze the bearings at 0°F (-17.75°C) for 30-45 minutes. Using gloves, remove the bearings from the freezer and slip them into the housing. As they heat to room temperature, full contact between bearing and housing will be achieved. The greatest advantage to this technique over traditional pressing is greater accuracy in alignment.

This type of mounting will not allow for misalignment or shaft deflection. Both are very critical in the smooth operation of Simplicity bearings. A rolling element bearing may appear to initially operate in this condition, but it is operating in an extremely preloaded condition and will prematurely fail and in most cases destroy the shafting. Simplicity bearings will indicate the problem immediately upon installation by failing to move due to the binding condition. There are alternative mounting options that work extremely well.

NOTE: Use "C" (compensated I.D.) series bearings.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

INSTALLING SIMPLICITY® BEARINGS

STRAIGHT BORE HOUSING - SLIP FIT BEARING

There are three basic configurations that work well, depending on the misalignment and shaft deflection in the application:

1. Virtually NO misalignment

This method allows for NO or very little shaft deflection and misalignment.

Standard I.D. bearings will need tighter alignment than a “C” series (compensated I.D.) bearing.

Standard retention methods are acceptable.

EXAMPLE: snap rings, epoxy, etc.

NOTE: If using epoxy, do not touch the bearing liner with the bonding agent!

This type of mounting will allow for minimum misalignment or shaft deflection. Both are very critical in the smooth operation of Simplicity bearings. A rolling element bearing may appear to initially operate in this condition, but it is operating in an extremely preloaded condition and will prematurely fail and in most cases destroy the shafting. Simplicity bearings will indicate the problem immediately upon installation by failing to move due to the binding condition.

INSTALLING SIMPLICITY® BEARINGS

STRAIGHT BORE HOUSING - SLIP FIT BEARING (cont.)

2. Standard applications with average misalignment

A self-aligning O.D. bearing is recommended.

EXAMPLE: FLA24, FMA30, FJA30

For details on the self-aligning O.D. feature, see page 41 of the product catalog.

The recommended method of retention for this mounting is a snap ring at each end.

NOTE: Do not use epoxy in this configuration. It will lock the bearing in place not allowing it to self-align.

Be sure to install the o-rings around the O.D. of the bearing to reduce noise while the bearing is in operation.

No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

INSTALLING SIMPLICITY® BEARINGS

STRAIGHT BORE HOUSING - SLIP FIT BEARING (cont.)

3. Severe misalignment

A standard O.D. bearing is recommended.

EXAMPLE: FL24, FM30, FJ30

Oversize the I.D. of the housing and install the bearing with o-rings. This will allow the bearing to “float” in the housing and match the misalignment or non-parallelism of the shafting.

The recommended method of retention for this mounting is a snap ring at each end.

NOTE: Do not use epoxy in this configuration. It will lock the bearing in place, not allowing it to self-align.

See page 50 of the product catalog for more details on this solution.

CHEMICAL REACTION CHART

The original FrelonJ® has almost universal chemical inertness. Only molten sodium and fluorine at elevated temperatures and pressures show any signs of attack. It is approved for use with liquid oxygen, N₂O₂ hydrazine, UDMH, hydrocarbon fuels, high strength hydrogen peroxide, etc.

The FrelonGOLD® material is a composite of PTFE and a bearing filler. The PTFE is chemically inert. The chemical resistance shown in the chart below is defined by the compatibility of the filler with the various chemicals.

Other data in the chart below applies to the bearing shell and pillow block materials. The table is provided as a reference only. The data given will be affected by factors such as temperature, PV, degree of contact, strength of solution, etc. In each specific application, it is always advisable to conduct specific testing to determine suitability of use. This table only addresses general corrosion, NOT galvanic, SCC, or other types of corrosion. Corrosion rates are at room temperature unless otherwise noted.

Standard and hard coat data only apply when the coating is intact. If the coating is worn through or damaged, an area of galvanic and pitting corrosion will be created. Then use the bare aluminum data.

Standard Simplicity products use aluminum alloy, which is known to have the best corrosion resistance of the high strength aluminum alloys. The sulfuric bath anodizing and nickel acetate sealing provide the best corrosion resistance available in anodized coatings. They can withstand a rigorous 14-day exposure in a 5% salt spray solution at 96°F per military specifications without significant damage. With the coating intact, it is considered to be inert in most fluids with a pH value between 5 and 8. Hard coat anodizing provides the same chemical resistance but is applied to a .002" thickness, providing a more durable surface that will stand up to greater abuse. However, if the coating is penetrated, the resistance is reduced.

Special stainless steel bearings use AISI 316 stainless, which has superior resistance over 303, 304, 420, 440, 17-4PH, and most other common stainless grades. 316 is generally considered to be the most corrosion resistant of conventional stainless steels.

NOTE: This information was compiled for Pacific Bearing® Company by Materials Engineering, Inc. of Virgil, IL. This specification information is believed to be accurate and reliable, however, no liability is assumed. INFORMATION IS FOR REFERENCE ONLY. USER MUST TEST SPECIFIC APPLICATIONS.

CCM60-xx	60	+0/-19	3.7	3.70
CCM80-xx	80	+0/-19	3.7	6.58

NOTES: Specify length in part number using mm.
 Example: for 8mm shafting total length 97mm = CCM08-97
 Ends of cut-to-length shafting are not coated.
 Fully coated shafting is available on special request.

PRE-DRILLED & TAPPED CERAMIC COATED ALUMINUM SHAFTING

- Aluminum alloy base material
- RC70 ceramic coated finish
- Designed to run with Simplicity FrelonGOLD® lined bearings
- Interchanges with standard pre-drilled shafting
- Non-magnetic and vibration resistant
- Weld splatter, paints, contaminants will not stick

PART NO.	NOMINAL SIZE	DIAMETER TOLERANCE CLASS "M"	HOLE SPACING		THREAD	MAX. LENGTH	WEIGHT
	(mm)	(μ m)	X	y		(m)	(kg/m)

PRODUCT OVERVIEW

- The Simplicity® ball bearing consists of an outer cylinder, ball retainer, balls and two end rings. The ball retainer which holds the balls in the recirculating tracks is held inside the outer cylinder by end rings.
- Those parts are assembled to optimize their required functions.
- The outer shell is heat treated to ensure long life.
- The ball retainer is molded from a durable polymer to ensure smooth motion.

FEATURES

High Precision and Rigidity -

The Simplicity® ball bearing is produced from a solid steel outer cylinder and incorporates an industrial strength polymer retainer.

Ease of Assembly -

The standard type of Simplicity® ball bearing can be loaded from any direction. Precision control is possible using only the shaft supporter, and the mounting surface can be machined easily.

Ease of Replacement -

Simplicity® ball bearing of each type are completely interchangeable because of their standardized dimensions and strict precision control. Replacement because of wear or damage is therefore easy and accurate.

Variety of Types -

PBC offers a full line of Simplicity® ball bearings: the standard, integral single-retainer closed type, the clearance adjustable type and the open types. The user can choose from among these according to the application requirements to be met.

ORDERING INFORMATION

NOTE: Precision of inscribed circle diameters and outside diameters for the clearance adjustable type (...-AJ) and the open type (...-OP) indicates the value obtained before the corresponding type is subjected to cutting process.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

LOAD RATING AND LIFE EXPECTANCY

The life (L) of a linear bushing can be obtained from the following equation with the basic dynamic load rating and the load applied to the bush:

$$L = \left(\frac{f_H \cdot f_T \cdot f_C \cdot C}{f_w \cdot P} \right)^3 \cdot 50 \text{ ————— } 1$$

- L : Rated life (km/in.)
- C : Basic dynamic load rating (N/#)
- P : Working load (N/#)
- f_w : Load coefficient
- f_H : Hardness factor (see page ???)
- f_T : Temperature coefficient (see page ???)
- f_C : Contact coefficient (see page ???)

The lifespan (L_h) of a linear ball bushing in hours can be obtained by calculating the traveling distance per unit time. The lifespan can be obtained from the following equation if the stroke length and the number of strokes are constant:

$$L_h = \left(\frac{L \cdot 10^3}{2 \cdot s \cdot n_1 \cdot 60} \right) \text{ ————— } (2)$$

- L_h : Lifespan (hr)
- L : Rated life (km/in.)
- s : Stroke length (m/in.)
- n₁ : Number of strokes per minute (cpm)

RELATION BETWEEN BALL CIRCUITS AND LOAD RATING

The Simplicity® linear ball bearings are constructed so that the ball circuits are spaced equally. The load rating varies according to the loaded position. The load ratings of the linear ball bearings from the dimensional tables are per track and increased loading can be achieved by equally sharing the load between the tracks.

The following table shows the increased value by the number of ball circuits in such cases:

LOAD RATING

Basic Dynamic Load Rating (C) -

This term is arrived at based on an evaluation of a number of identical linear systems individually run in the same conditions, if 90% of them can run with the load (with a constant value in a constant direction) for a distance of 50 km without damage caused by rolling fatigue. This is the basis of the rating.

Allowable Static Moment (M) -

This term defines the allowable limit value of static moment load, with reference to the amount of permanent deformation similar to that used for evaluation of basic rated load (C₀).

Static Safety Factor (f_s) -

This factor is used based on the application condition as shown in Table 1.

TABLE 1 - STATIC SAFETY FACTORS

CONDITION OF USE	LOW LIMIT OF f _s
When the shaft has less deflection and shock	1 to 2
When elastic deformation should be considered with respect to cantilever load	2 to 4
When the equipment is subject to vibration and impacts	3 to 5

Basic Static Load Rating (C₀) -

This term defines a static load such that, at the contacting position where the maximum stress is exercised, the sum of the permanent deformation of the rolling elements and that of the rolling plane is 0.0001 time of the diameter of the rolling elements.

Number of Rows	4	5	6
C ₀ Load Rating Specified on the Tables			
C _{0max} Maximum Load Rating			
Load Ratio C _{0max} /C ₀	1.414	1.463	1.280

NOTES: 3 track bearing is equal.
Open bearing load is de-rated by 50% if going against the opening.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

CLEARANCE & FIT

Standard-type Simplicity® linear ball bearings matched to a shaft that provides inadequate clearance may result in early bearing failure and/or rough linear motion. The clearance adjustable linear ball bearings and open linear ball bearings can be adjusted when assembled in the housing by controlling the housing bore. However, too much clearance will increase

the deformation of the linear ball bearing, which will affect its precision and life. Therefore, the appropriate clearance between the ball bearing and shaft, and the appropriate linear ball bearing housing bore are required based on application. Table 2 shows recommended fit of the linear ball bearing:

TABLE 2

MODEL	DIVISION	SHAFT		HOUSING	
		NORMAL FIT	TRANSITIONAL	LOOSE FIT	TIGHT FIT
JP	High Precision	g6	h6	H7	J7
EP	High Precision	g6	h6	H7	J7
IP	High Precision	h6	j6	H7	J7

SHAFT & HOUSING

To optimize performance of the Simplicity® linear ball bearing it is recommended that a high precision shaft and pillow block are required.

Shaft -

The rolling balls in the Simplicity® linear ball bearing are in line contact with the shaft surface. Therefore, the shaft dimensions, tolerance, surface finish, and hardness greatly affect the performance of the linear ball bearing. The shaft should be manufactured to the following tolerances:

- 1) Surface finish critically affects the smooth rolling of balls; Shaft surface finish should be 6-8 micro (RA# 7.2 to 10.8 a 1.11 to 1 ratio).

- 2) Shaft hardness should be HRC 60 to 64. Hardness less than HRC 60 will decrease the life/load, see page 126.
- 3) Preload increases the frictional resistance slightly. If the preload is too tight, the deformation of the bearing sleeve will shorten the linear ball bearing's life.

Housing -

There are a wide variety of housings differing in design, machining, and mounting. See Table 2 (above) and the following section on mounting requirements.

MOUNTING

When inserting the linear ball bearing into the housing, do not hit the linear ball bearing on the end-retaining ring, but apply pressure either by hand or arbor on the linear ball bearing sleeve (See Fig.1) To insert the shaft into the mounted linear ball bearing, make sure the shaft is chamfered and be careful not to push on the balls by inserting the shaft at an angle. Note that if two shafts are used in parallel, the parallelism is an important factor to assure smooth linear movement and not damage the linear ball bearings.

Examples of Mounting -

The popular way to mount linear ball bearings is with a slight preload. Pacific Bearing recommends a slight clearance fit-up to ensure proper life. The examples, Figs. 2 to 6, show the inserted linear ball bearing using a variety of retention methods.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

RATING LIFE

Rating Life of the Linear System -

As long as the linear system reciprocates while being loaded, continuous stress acts on the linear system to cause flaking on the rolling bodies and planes because of material fatigue. The traveling distance of linear system until the first flaking occurs is called the life of the systems. The life of the system varies even for the systems of the same dimensions, structure, material, heat treatment and processing method, when used in the same conditions. This variation is brought about from the essential variations in the material fatigue itself. The rating life defined below is used as an index for the life expectancy of the linear system.

Rating Life (L) -

Rating life is the total travelling distance that 90% of a group of systems of the same size can reach without causing any flaking when they operate under the same conditions. The rating life can be obtained from the following equation with the basic dynamic load rating and the load on the linear system:

$$\text{For ball type: } L = \left(\frac{C}{P}\right)^3 \cdot 50 \text{ ————— (1)}$$

L : Rating life (km)

C: Basic dynamic load rating (N)

P : load (N)

Consideration and influence of vibration impact loads and distribution of load should be taken into account when designing a linear motion system. It is difficult to calculate

the actual load. The rating life is also affected by the operating temperature. In these conditions, the expression (1) is arranged as follows:

For ball type:

$$L = \left(\frac{f_H \cdot f_T \cdot f_C \cdot C}{f_W \cdot P}\right)^3 \cdot 50$$

L : Rating life (km)

f_H : Hardness factor (See Fig.1)

C : Basic dynamic load rating (N)

f_T : Temperature coefficient (See Fig.2)

P : Load (N)

f_C : Contact coefficient (See Table 2)

f_W : Load coefficient (See Table 3)

The rating life in hours can be calculated by obtaining the travelling distance per unit time. The rating life in hours can be obtained from the following expression when the stroke length and the number of strokes are constant:

$$L_h = \left(\frac{L \cdot 10^3}{2\ell_s \cdot n_1 \cdot 60}\right)$$

L_h : Rating life in hours (hr)

ℓ_s : Stroke length (m)

L : Rating life (km)

n₁ : No.of strokes per minute (cpm)

SAMPLE CALCULATIONS

1. Obtaining the rated life L and lifespan L_h of the Simplicity® linear ball bearing used in the following conditions:

Linear ball bearing	EP20G
Stroke length50mm
Number of strokes per minute.....	.50cpm
Load per bush490N

The basic dynamic load rating of the linear ball bearing is 882N from the dimension tables. From equation (1), therefore, the rated life L is obtained as follows:

$$L = \left(\frac{f_H \cdot f_T \cdot f_C \cdot C}{f_W \cdot P}\right)^3 \cdot 50 \quad f_H=f_T=f_C=f_W=1.0$$

$$= \left(\frac{882}{490}\right)^3 \cdot 50 = 292\text{km}$$

From equation (2), the lifespan L_h is obtained as follows:

$$L_h = \frac{L \cdot 10^3}{2 \cdot \ell_s \cdot n_1 \cdot 60} = \frac{292 \cdot 10^3}{2 \cdot 0.05 \cdot 50 \cdot 60} = 973\text{hr}$$

2. Select the linear ball bearing type by satisfying the following conditions:

Number of linear bushing used.....	4
Stroke length.....	1m
Traveling speed.....	10m/min.
Number of strokes per minute.....	5spm
Lifespan.....	10,000hr
Total load	980N

From equation (2), the traveling distance within the lifespan is obtained as follows:

$$L = 2 \cdot \ell_s \cdot n_1 \cdot 60 \cdot L_h = 6,000\text{km}$$

From equation (1), the basic dynamic load rating is obtained as follows:

$$C = \sqrt[3]{\frac{L}{50} \cdot \left(\frac{f_W}{f_H \cdot f_T \cdot f_C}\right) \cdot P} = 1492\text{N}$$

Assume the following with a pair of shafts each with two linear ball bearings: f_C = 0.81 f_W = f_T = f_H = 1

As a result, EP20G is selected from the dimension table as the Simplicity® linear ball bearing type satisfying the value of C.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

RATING LIFE (cont.)

Hardness Factor (f_H) -

The shaft must be sufficiently hardened when a linear bushing is used. If not properly hardened, permissible load is lowered and the life of the linear ball bearings will be shortened.

Temperature Coefficient (f_T) -

If the temperature of the linear system exceeds 100°C, hardness of the linear system and the shaft lowers to decrease the permissible load compared to that of the linear system used at room temperature. As a result, the abnormal temperature rise shortens the rating life.

NOTES: Maximum temperature of plastic retainer 212°F or 100°C.
Maximum temperature 176° per Table 6.

Contact Coefficient (f_C) -

Generally two or more linear bearings are used on one shaft. Thus, the load on each linear system differs depending on each processing accuracy. Because the linear bushings are not loaded equally, the number of linear bushings per shaft changes the permissible load off the system.

TABLE 2 - CONTACT COEFFICIENT

NUMBER OF LINEAR SYSTEMS PER SHAFT	CONTACT COEFFICIENT f_C
1	1.00
2	0.81
3	0.72
4	0.66
5	0.61

Load Coefficient (f_W) -

When calculating the load on the linear system, it is necessary to accurately obtain object weight, inertial force based on motion speed, moment load, and each transition as time passes. However, it is difficult to calculate those values accurately because reciprocating motion involves the repetition of start and stop as well as vibration and impact. A more practical approach is to obtain the load coefficient by taking the actual operating conditions into account.

TABLE 3 - LOAD COEFFICIENT

OPERATING CONDITIONS	f_W
Operation at low speed (15m/min.or less) without impulsive shock from outside	1.0 to 01.5
Operation at intermediate speed (60m/min.or less) without impulsive shock	1.5 to 2.0
Operation at high speed (over 60m/min.) with impulsive shock from outside	2.0 to 3.5

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

FRICITIONAL RESISTANCE

The static frictional resistance of the Simplicity® linear system is so low that it is only slightly different from the kinetic frictional resistance, enabling smooth linear movement from low to high speeds. In general, the frictional resistance is expressed by the following equation.

$$F = \mu \cdot W + f$$

F : Frictional resistance μ : Coefficient of friction

W : Load weight f : Sealing resistance

The frictional resistance of each PBC linear system depends on the model, load weight, speed, and lubricant. The sealing resistance depends on the lip interference and lubricant, regardless of the load weight. The sealing resistance of one linear system is about 200 to 500 gf. The coefficient of friction depends on the load weight, moment load, and preload.

TABLE 5 - COEFFICIENT OF LINEAR SYSTEM FRICTIONS (μ)		
LINEAR SYSTEM TYPE	MODELS	COEFFICIENT OF FRICTION (μ)
Linear Bearing	JP, EP, IP	0.002 to 0.003

AMBIENT WORKING TEMPERATURE

The ambient working temperature range for each PBC linear system depends on the model. Consult PBC on use outside the recommended temperature range.

Temperature conversion equation:

$$C = \frac{5}{9}(F - 32) \quad F = 32 + \frac{9}{5}C$$

TABLE 6 - AMBIENT WORKING TEMPERATURE		
LINEAR SYSTEM TYPE	MODELS	AMBIENT WORKING TEMPERATURE
Linear Bushing	JP, EP, IP	-20 to 80°C, 176°F

LUBRICATION AND DUST PREVENTION

Using PBC linear systems without lubrication increases the abrasion of the rolling elements, shortening the life span. The PBC linear systems therefore require appropriate lubrication. For lubrication PBC recommends turbine oil conforming to ISO Standards G32 to G68 or lithium base soap grease No.2. Some PBC linear systems are sealed to block dust out and seal lubricant in. If used in a harsh or corrosive environment a protective cover should be used.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

PRODUCT OVERVIEW

Pacific Bearing is a worldwide supplier of innovative linear and rotary motion solutions. Since our founding in 1982, when Pacific Bearing pioneered the first two-piece bonded Simplicity® linear bearing, we have built a solid reputation for providing innovative application solutions solving the toughest linear and rotary problems. The success and continued demand for the Simplicity® self-lubricated linear and rotary bearings, has broadened our market opportunities and fostered new product introductions. The Simplicity® product family has expanded to include thrust and sleeve bearings, die set bushings, square bearings, pillow blocks, and a complete line of European and Japanese metric bearings.

Today, Pacific Bearing's design innovation extends beyond plane bearings. The introduction of FrelonGOLD® bearing liner material in 1998, created the opportunity to introduce Feather Shafting - a new lightweight ceramic coated roundway shaft that is approximately 1/3 the weight of steel shafting plus, providing the smoothest and quietest linear and rotary motion. Combining both Simplicity® and Feather Shaft® technologies, Pacific Bearing created Dolphin Guides® and Mini Rail® Linear Guides. They feature our simple, cost effective, two-piece linear guides that afford the design engineer, integration, flexibility, and direct compatibility with competitive Linear Guide technologies.

Redi-Rail® was created to meet the industry demand for faster, lighter and quieter linear motion applications. Combining lightweight structural components, precision steel inner raceways, and high-speed self lubricated roller bearings; Redi-Rail delivers high-speed performance (8 meters/second), with continuous rail lengths available up to 19 feet (6m). Redi-Rail® Linear guides are also configured in V-Guide Systems to provide high speed, in moderate load capacity in harsh environments.

Hevi-Rail®, heavy-duty Linear Bearing Systems provide high load capacity and simple installation. Hevi-Rail is a sealed, self-lubricated bearing that is capable of addressing both radial and axial loads up to 41 KN. Utilizing Hevi-Rail combination bearings, coupled with our complete line of accessories; eliminates components, reduces installation time, and subsequently lowers costs.

Pacific Bearing now offers its linear motion components completely assembled in pre-engineered Systems, Slides and Stages. We also offer ball screw, lead screw, and belt drives in addition to linear motors, and cylinders. Catalogue systems are available in a few days and custom systems are also quickly available.

Pacific Bearing is proud to introduce its light-weight polymer sleeve and flange bearings to their product family. Polymer bearings are used in a variety of applications with specially formulated compounds with the following advantages:

Main advantages of plane polymer bearings:

- Absorb vibrations
- Anti-corrosive
- Chemically resistant
- Lightweight
- Provide additional functions (integral seals, grease retention pockets etc.)
- Highly economic because of:
 - Lower unit costs
 - Fewer components
 - No maintenance costs

Additional advantages of compound plane bearings:

- Modified for various applications
- Low density
- Adjustability with electric insulation and conductivity
- Suitable for dry runs
- Friendly to edge loading
- Can show magnetic properties
- Resistant to ionizing radiation

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

MAIN ADVANTAGES

Maintenance-free self-lubricated:

PBC compounds lubricants in balanced ratios into the polymer matrix and ensure through fiberate micro-wear during running in for clean and continuous auto lubrication. During micro-wear a transfer coating is built enabling optimal sliding performance. The basic polymers and their additives already own good tribological properties.

Long service life:

The homogeneous structure of the compound plane bearings prevent thin run or wear layers which would shorten service life right from the beginning. The basic polymer with its mainly synthetic reinforcement additives forms an intimate matrix for other additives. There is no abrasive wear of the shafts because the commonly used glass fibers have been removed.

Low friction:

Static and dynamic coefficients of friction are close to each other due to the high amount of PTFE and other special additives in the compounds. Thus, we ensure stick-slip-free running at lower speeds. The plane bearing also runs with much less noise. The frictional behavior of the compound plane bearings depends mainly on temperature, sliding speeds, types of movement and loads. Surface structure and the circumstances of dry running or greasing standards substantially influence frictional behavior. Through the appropriate lubrication the coefficient of friction can be reduced even further.

High dimensional stability:

All compound plane bearings take in virtually no water, which can be disregarded to dimensional accuracy in connection with the installation. Fiber strengthening reduces thermal expansion/contraction and improves the press-fit at higher temperatures.

PLANE BEARINGS FOR ALL APPLICATIONS

Pacific Bearing produces compound plane bearings through an injection molding process.

We can help you select a suitable material for a specific application from our wide range of materials. Our technical staff will support you at every step of the way. PBC will find the best compound for your application – with regard to costs as well as effectiveness/performance.

Whether you are looking for standard parts or custom/proprietary components we can provide standard plane bearings. Special components and seals are available as well.

Standard Plane Bearings:

Standard bearings are stocked in compounds A and E:

- Bushings
- Flanged bushings
- Thrust washers
- Bushings with integral seals

You can select exact dimensions from the separate dimension table.

Minimal wear:

Compound plane bearings are extremely wear resistant in rotating and axial bearings as well as in hinge movements under high loads.

High loading capacity:

Our compound plane bearings can withstand immense forces and pressures. As well as edge loads, which do not cause problems in contrast to common plane bearings made of non-ferrous metals or composite materials. Depending on the compound chosen, high pressures are also permissible.

Broad temperature range:

Depending on the material temperatures of -200°C/-328°F up to +250 °C can be withstood during application. Always check the compound specifications in each application with regard to temperature tolerances.

Improved thermal conductivity:

Polymer compound plane bearings show an improved thermal conductivity. Higher rpm/sfm during continuous operation are possible thanks to a better press-fit of the plane bearing in its housing. This is achieved through fiber strengthening.

Plane Bearings with Integral Seals:

Plane bearings with integral seals have proven superior in sustaining the basic advantages of our compound plane bearings even in tough environments.

The advantages:

- Integral seals keep away dirt and water from the bearing
- Initial lubrication is suggested
- Safe from corrosion

As a standard we provide bearings with double-sided integral seals.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

HIGH PERFORMANCE PLANE BEARINGS

High performance plane bearings are a specialty of Pacific Bearing, which is distinguished by a quality-analytic separation of the bearing function. We manufacture them by multi cavity injection molding process. These are high filled and form a stable basic body and a sliding layer with the most favorable wear and friction values. Additionally, we include specially arrayed grease retention pockets. Integrated elastomer integral seals complement these bearings.

The layers of our high performance plane bearings are built up as follows:

- **Outer layer:** A high-filled basic body guarantees press-fit and pressure capacity with high temperatures as well as with high stress
- **Inner layer:** Tribologically modified sliding layer for optimal wear and friction characteristics

They show the particular qualities of:

- Increased application possibilities
- Corrosion resistance
- Low weight
- Optimized performance
- Optimal adaptation to your requirements through suitable combinations of materials and design

SPECIAL PARTS

We can deliver special forms and dimensions of parts under wear and friction demands, which we design, and manufacture individually along your requirements. Our service covers the material side as well as dimensional interpretation of the component.

Other special components are, for example:

HOW TO CHOOSE THE BEST MATERIAL

The optimal application of a plane bearing in a system essentially depends on temperature, sliding speed, the occurring loads and environmental influences. We offer a wide spectrum of materials for the most varied applications. The technical data should give you an orientation and simplify the choice. In general, testing is advised.

With only few exceptions we dispense with the use of glass fibers, which considerably enhances sliding performance and increases service life. Nevertheless, with synthetic fiber reinforcement the press-fit in housing shows increased temperature dependence. Hence, continuous use temperature should as a rule not exceed 60% of the maximum sliding surface temperature if special fixation offered or safety in the mounting arrangement is relinquished.

Our technical staff not only offer you a wide choice of materials but we can provide additional more detailed technical data. Apart from the material offered we also have access to all the other commonly used polymers or we can use some suitable material from our own Value Added Polymer series of compounds. Furthermore, we can design the optimal material for your demands in our in-house developing department and then produce the new material.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

Simplicity® Plane Bearings

Overview of PBC Compounds A & E - Polymer Series

These PBC materials (maintenance free) are standardized compounds for our plane bearings. Upon request we can also provide other standard and special bearings and sliding elements made of different materials or with divergent dimensions.

We solve a variety of problems and produce special forms as well as special dimensions according to your application needs even if they are not included in our tables.

Pacific Bearing® is always extending its standard mold family and adding proprietary features to custom molds as well.

COMPOUND A

Characteristics:

- Thermoplastic compound made of PEEK polymer matrix reinforced with synthetic fibers and modified with triboadditives
- Highly efficient high temperature material with high chemical and good wear resistance
- Recommended tolerance for press fit bushings: housing H7, shaft h7 - h9
- Color: black

Applications:

Industry – textile and knitting machinery, baking machinery, relay and control valves, powder coating equipment, chemical plants, armatures

Availability:

In stock – bearings, flanged bearings. Production to order – thrust washers, special parts of all kinds

Material structure:

PEEK + carbon fibers + PTFE + graphite

Grinding pattern A

Operation conditions:

- Dry good
- Oil lubricated..... optimum
- Grease lubricated optimum
- Water lubricated optimum
- Medium lubricated optimum

COMPOUND E

Characteristics:

- Filled thermoplastic compound made of PBT polymer matrix and triboadditives
- Good sliding performance under moderate operational conditions
- The E standard program is interchangeable with bushings according to DIN1494/ISO3547
- Very cost-effective sliding material
- Recommended tolerance for press fit bushings: housing H7, shaft h7 - h9
- Color: brown

Applications:

Industry – medical equipment, textile machinery, transport devices, apparatus engineering, furniture, materials handling technology, electronics, valve technology, agricultural machinery

Availability:

In stock - bushings, flanged bushings, bushings with integrated sealings, thrust washers.

Production to order - special parts of all kinds

Material structure:

PBT + powdered bronze + PTFE

Grinding pattern E

Operational conditions:

- Dry good.....good
- Oil lubricatedgood
- Grease lubricatedgood
- Water lubricatedless good
- Medium lubricatedless good

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

COMPOUND B

Characteristics:

- Injection-molded polyamidimide modified with special additives
- Irreversible cross-linking through by thermal treatment
- High temperature material for demanding components with low thermal expansion
- High toughness and mechanical consistency
- High wear resistance against vibrating oscillations
- Good chemical resistance
- Recommended tolerance for press fit bushings: housing H7, shaft h7 - h9
- Color: dark grey

Applications:

Automobile industry – automatic transmission, pumps, labyrinth seal in turbo blowers, piston rings, valve seats, integral seals

Industry – continuous furnace, cockles for coating, textile machinery

Other – aviation and astronautics, extreme high- and low-level temperature operations

Availability:

Production to order – bearings and special parts of all kinds

Material structure:

PAI + graphite + PTFE + additive

Grinding pattern B

Operational conditions:

- Drygood
- Oil lubricatedvery good
- Grease lubricatedgood
- Water lubricated.....good
- Medium.....good

COMPOUND C

Characteristics:

- Thermoplastic compound made of PBT polymer matrix reinforced with long glass fibers and modified with triboadditives
- Improved performance compared to E, as well as lower wear rate and less shrinkage
- Excellent press-fit by long glass fibers
- Recommended tolerance for press fit bushings: housing H7, shaft h7 - h9
- Color: olive

Applications:

Industry – medical equipment, textile machinery, transport devices, apparatus engineering, furniture, materials handling technology, electronics, valve technology, agricultural machinery

Availability:

Production to order – bushings, flanged bushings, bushings with integrated sealings, thrust washers special parts of all kinds.

Material structure:

PBT + powdered bronze + PTFE + aramid fibers

Grinding pattern C

Operational conditions:

- Drygood
- Oil lubricated.....good
- Grease lubricatedgood
- Water lubricated.....good
- Medium lubricatedless good

COMPOUND D

Characteristics:

- Thermoplastic compound made of PBT polymer matrix reinforced with long glass fibers and modified with triboadditives
- Good sliding performance under moderate operational conditions
- Recommended tolerance for press fit bushings: housing H7, shaft h7 - h9
- Color: grey

Applications:

Automobile industry – hinges, guides for sliding and lifting covers

Industry – formed parts for machinery and apparatus engineering, adjustment devices

Availability:

Production to order – bushings, flanged bushings, thrust washers, special parts of all kinds

Material structure:

PBT + long glass fibers + powdered bronze + PTFE

Grinding pattern D

Operational conditions:

- Drygood
- Oil lubricatedgood
- Grease lubricatedgood
- Water lubricatedless good
- Medium lubricatedless good

COMPOUND F

Characteristics:

- Thermoplastic compound made of made of POM polymer matrix with PTFE
- Corresponds to BGA/FDA recommendations. Suitable for contact with food.
- Recommended tolerance for press fit bushings: housing H7, shaft h7 - h9
- Color: white

Applications:

Industry – racks and packaging machines, pumps, butcher’s shop equipment, medical equipment

Availability:

Production to order – bushings, flanged bushings, thrust washers, bushings with integrated seals, special parts of all kinds

Material structure:

POM + PTFE

Grinding pattern F

Operational conditions:

- Dry goodgood
- Oil lubricatedgood
- Grease lubricatedgood
- Water lubricatedless good
- Medium lubricatedless good

Simplicity® Plane Bearings

Overview of PBC Compound G - Polymer Series

COMPOUND G

Characteristics:

- Thermoplastic compound made of PPS polymer matrix reinforced with glass fibers and triboadditives
- High hydrolysis and temperature resistance
- Good sliding performance under moderate operational conditions
- Recommended tolerance for press fit bushings: housing H7, shaft h7 - h9
- Color: beige

Applications:

Industry – various outdoor applications

Automobile industry – rear windscreen wiper, pump bearing

Availability:

Production to order – bushings, flanged bushings, thrust washer, special parts of all kinds

Material structure:

PPS + glass fibers + PTFE

Grinding pattern G

Operational conditions:

- Dryless good
- Oil lubricatedgood
- Grease lubricatedgood
- Water lubricatedgood
- Medium lubricatedgood

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. TOLERANCE

Polymer plane bearings are suitable as press-in bushing, preferably used in housings with tolerance H7. The press fit oversize depends on the nominal diameter and the respective material. The press fit oversize is about 0.5 - 1.5% according to the chosen diameter.

After assembly in the inside diameter adjusts itself to the nominal value. A certain clearance in the bearing is necessary to guarantee faultless operation under all operational conditions. Inside diameter lies in the range of tolerance F10 according to compound.

Shafts are mainly in tolerance h9 - h7. The ideal sliding counterpart is steel with a ground surface (surface roughness value with parameter Ra 0.4 to 0.8 μm) and a minimum hardness of 50 HRC. Apart from hardened steel nearly all other common shaft materials can be used: stainless steel, carbon steel, non-ferrous metals and plastics. Special compounds are available for soft shafts made for example out of non-ferrous metals or aluminum alloys. Thus, we can achieve very low to no wear in the sliding counterpart.

For special applications please contact us. We are able to formulate service life on the basis of our tests for and experience from a huge number of applications.

MACHINING

Polymer plane bearings can be reworked without problem.

Milling, turning on a lathe, sawing or cutting can be done, however, please do not alter I.D.

LUBRICATION

Compound plane bearings are self-lubricating and therefore maintenance-free. Nevertheless, initial lubrication during assembly or cooling by environmental media can multiply loading capacity and service life. The compounds are resistant against most of the common greases and oils. Detailed information can be obtained from the chemicals resistance list in this catalog or you can receive a detailed list on request.

ASSEMBLY

It is preferable to press polymer plane bearings into the housing with an arbor parallel to the axis. The one-sided chamfer on the bearing simplifies assembly. A similar chamfer should also be part of the housing.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

HOW THE SURROUNDINGS INFLUENCE PLANE BEARINGS

Polymer plane bearings made of specially modified compounds for the best operating results in maintenance-poor or maintenance-free surroundings. Through many years of experiences we have continuously improved our materials. Today, we are able to cover a large segment of applications with our products.

Many factors have an influence on the successful operation of plane bearings. Temperature is a determining factor. Polymers change their properties more radically at different temperatures than conventional metal-polymer bearings.

Approximate values and orientation cannot replace a test under real everyday conditions of a system. Check operational temperature, loads, life, safety and the insertion tolerance and lubrication edge pressures or unwanted inclusion of dirt particles.

NOMENCLATURE

The following parameters and variables are being used:

TERM	FORMULA TYPE	UNIT
radial bearing load	F	N
inner diameter	d	mm
bushing width	L	mm
wall thickness	s	mm
sliding speed	v	m/s
coefficient of friction	ϑ	
environment temperature	ϑ_U	°C
max. sliding surface temperature	ϑ_{max}	°C
specific load	p	MPa
revolutions per minute	n	U/min
rotation angle	φ	°
compensation constant PV-value	k_1, k_2	
thermal conductivity compound	λ_C	W/mK
thermal conductivity shaft	λ_W	W/mK

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

AVERAGE LOAD

The active radial force affecting the plane bearing and the projected supporting surface combine to the average load. The value results from this formula:

$$\bar{p} = \frac{F}{d \cdot L} [N/mm^2]$$

SLIDING SPEED

Sliding speed is either the direct result of the linear speed or with rotating movements results from the revs:

$$v = \frac{n \cdot d \cdot \pi}{1000 \cdot 60} [m/s]$$

or with oscillator movements result in:

$$v = \frac{d \cdot \pi}{60 \cdot 100} \cdot \frac{2\varphi \cdot n}{360} [m/s]$$

PERMISSIBLE PV VALUE

The permissible PV value is the product of sliding speed and the corresponding load allowance. With polymer plane bearings the PV value can be determined via the following formula:

$$\bar{p}v_{zmax} = \frac{\pi \cdot \Delta\vartheta}{\mu} \left(\frac{k_1 \cdot \lambda_c}{s} + \frac{k_2 \cdot \lambda_w}{2L} \right) \cdot 10^{-3} [MP\alpha \cdot \frac{m}{s}]$$

and

$$\Delta\vartheta = \vartheta_{max} - \vartheta_u$$

The permissible PV value should be greater or equal to the PV value formulated from speed and load data for the final application!

LIFE EXPECTANCY OF A PLANE BEARING

To calculate the service life the complete group of possible strains must be taken into consideration. If in doubt, talk to a member of our skilled and experienced technical staff. They will help you interpreting and calculating the length of service life.

The following correction factors apply:

BUSHING WALL THICKNESS <i>s</i>	<i>k</i> ₁	<i>k</i> ₂
≤ 2 mm	0.50	0.042
> 2 mm	0.75	0.058

The following thermal conductivities have to be applied to the shaft material:

MATERIAL	SHAFT THERMAL CONDUCTIVITY λ [W/mK]
Aluminum bronze	120
Aluminum alloy	156
Brass	80
Bronze	46
Carbon Steel	46
Cast iron	60
Low alloy steel	55
Phosphor bronze	75
Stainless steel	15

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

Sleeve Bearings

INSTALLATION INSTRUCTIONS

- Slip the bearing sleeve into the housing and epoxy into place with Loctite™ or similar type bonding agent.

CAUTION: Do NOT let any of the adhesive touch the bearing liner. It will harden and interfere with the running clearance.

- Freeze the bearings at 0°F (-17.75°C) for 30-45 minutes. Using gloves, remove the bearings from the freezer and slip them into the housing. As they heat to room temperature, full contact between the bearing and housing will be achieved. The greatest advantage to this technique over traditional pressing is greater accuracy in alignment.

ORDERING INFORMATION

NOTE: Lengths not listed above must be quoted.

PRODUCT OVERVIEW

Based on Pacific Bearing Company's proven Simplicity technology, Mini-Rail miniature linear guides provide smooth and quiet linear motion. The self-lubricating design requires no sealing, emits virtually no particulates, tolerates high temperature extremes and has no rolling elements that can cause catastrophic failure.

Mini-Rail miniature linear guides are available in five sizes: 7, 9, 12, 15 and 20mm - in lengths up to 3600mm, meaning no cumbersome butt joints. These guides are precision manufactured out of lightweight aluminum alloys to ensure long life and corrosion resistance.

An economical alternative to conventional miniature linear guides, Mini-Rail requires no maintenance, is fully interchangeable with industry standard sizes and is maintained in stock for quick delivery.

TECHNICAL DATA

Mini-Rail is offered in three design configurations:

Precision Series: Ceramic coated rails and carriages are corrosion resistant. FrelonGold® self-lubricating liner delivers the best overall performance, the highest loads, the best wear life, and speeds. Most precise running clearance for high precision applications.

Compensated Precision Series: Same as Precision Series (above) except with additional clearance provided to tolerate misalignment.

Commercial Series: Best value for less demanding applications. Clear anodized coating provides a measure of corrosion resistance. FrelonJ® self-lubricating liner is great for washdown applications.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

NOTES: Add the overall length of the rail to the part number, EXAMPLE "MR12-220" for a Precision Series assembly with a 220mm long rail.
Cut-to-length rails are available up to 3600mm.
The "S" dimension will remain constant at one end unless requested otherwise.

Standard and cut-to-length rail ends are NOT coated. Fully coated rails are available upon request.
All carriage mounting holes are through tapped except MR20 12.5mm of thread.

PERFORMANCE RATINGS FOR LINEAR MOTION

Plane bearings are rated by their limiting PV, which is a combination of load over a given surface area and the velocity.

BEARING MATERIAL	MAX. "PV"	MAX. "P"	MAX. "V" (NO LUBRICATION)
FrelonGold®	20,000 (psi x ft./min.) or 0.7 N/m ² x m/s	3000 psi or 20.68 N/mm ²	300 sfm or 1.524 m/s
FrelonJ®	10,000 (psi x ft./min.) or 0.35 N/m ² x m/s	1500 psi or 10.34 N/mm ²	140 sfm or 0.711 m/s

PV = The performance measurement of plane bearings.

PV = P x V, where P = pressure (load) in psi (kgf/cm²)

V = velocity (speed) in sfm (m/min.)

NOTE: All three parameters must be met by an application for the bearing to perform properly.

CANTILEVERED LOADS

Binding of the carriage will occur if the 2:1 ratio for cantilevered loads and drive forces is exceeded. This principle is not load or force dependent. It is a product of the coefficient of frictions associated with plane bearings. Contact factory or website for additional information.

LOAD/MOMENT CONVERSION

N = 4.45 x (lbs.)

N-m = 0.113 x (in.-lbs.)

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

MTR SERIES

- Miniature profile rail alternative
- Interchangeable with industry standards
- SimGlide™ Polymer inserts
- LaZer Straight™ rail

Note: Not available for sale, resale or distribution in Germany.

Materials:

LaZer Straight™ rail
SimGlide™ Polymer Inserts

Working Temperatures: -40C to 90C (-40F to 195F)

Coefficient of Friction: 0.1- 0.2

Maximum Velocity: 10 m/s (2000 fpm) for intermediate application and 8 m/s (1600 fpm) for continuous application

Maximum PV Value: 10,000 psi - fpm

NOTE: Apply a load reduction factor 0.25 on Fy rating if the system is used inverted.

ORDERING INFORMATION

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

MRR SERIES

- Durable polymer rollers ensure quiet operation
- Factory adjusted
- Rails can be butt-jointed for unlimited travel
- Pre-lubricated for long life
- Low cost
- Smooth operation
- Corrosion resistant
- Light loads

Materials: POM based polymer coated rollers
LaZer Straight™ ceramic coated aluminum rails
300 series stainless steel roller shafts

Working Temperatures: -20C to 90C (-4F to 195F)

Coefficient of Friction: 0.1- 0.2

Maximum Velocity: 5 m/s

Rail Weight: 0.48 G/mm

Carriage Assembly Weight: 85.0 G

3D models can be downloaded from our website at www.pacific-bearing.com.

NOTES: Add the overall length of the rail "L" to the part number.
EXAMPLE "MRR20-220" for a 220mm long rail.

Cut-to-length rails are available up to 3600mm.
"Y" dimension will remain constant at one end unless requested otherwise.

LOAD CAPACITY

PART NUMBER	LOAD CAPACITY

Mini-Rail® LS/MS Series

Miniature Lead Screw - Driven Slides

MINI RAIL® LS/MS SPECIFICATIONS

- Bipolar
- Chopper Drive
- 100% Duty Cycle
- 5.54mm (0.218") Lead Screw

Size 17 Stepper Motor with 5.54mm (0.218") Screw

LINEAR TRAVEL PER STEP	
0.001524 mm (.00006")	
0.003048 mm (.00012")	
0.006096 mm (.00024")	
0.012192 mm (.00048")	
0.024384 mm (.00096")	
0.048768 mm (.00192")	

NOTES: Rail ends are NOT coated. Fully coated rails are available upon request.

PERFORMANCE RATINGS FOR LINEAR MOTION

Plane bearings are rated by their limiting PV, which is a combination of load over a given surface area and the velocity.

BEARING MATERIAL	MAX. "PV"	MAX. "P"	MAX. "V" (NO LUBRICATION)
FrelonGold®	20,000 (psi x ft./min.) or 0.7 N/m ² x m/s	3000 psi or 20.68 N/mm ²	300 sfm or 1.524 m/s

PV = The performance measurement of plane bearings

PV = P x V where P = pressure (load) in psi (kgf/cm²)

V = velocity (speed) in sfm (m/min.)

NOTE: All three parameters must be met by an application for the bearing to perform properly.

CANTILEVERED LOADS

Binding of the carriage will occur if the 2:1 ratio for cantilevered loads and drive forces is exceeded. This principle is not load or force dependent. It is a product of the coefficient of frictions associated with plane bearings. Contact factory or website for additional information.

LOAD/MOMENT CONVERSION

$$N = 4.45 \times (\text{lbs.})$$

$$N\text{-m} = 0.113 \times (\text{in-lbs.})$$

STATIC LOAD DATA

The numbers below are for rails in a static condition. Refer to the calculations below to establish dynamic parameters.

F (N)	MSL (N)*
3559	6005

F (N)
578

F (N)	Mx (N-m)	My (N-m)	Mz (N-m)
1112	24.9	14.7	14.7

LS SERIES

- Right hand rolled thread
- 303 stainless steel screw with TFE coating
- Self-lubricating Polyacetal, anti-backlash nut
- Lengths up to 640mm
- Three (3) leads available
- Optional hand brake

3D models can be downloaded from our website at www.pacific-bearing.com.

NOTE: Other sizes available soon!
Check our website for available sizes.

NOTES: Maximum length for lead screw driven MR is 640mm.
Standard and cut-to-length rail ends are NOT coated. Fully coated rails are available upon request.

Mini-Rail® MS Series

Miniature Lead Screw - Driven Slides

MS SERIES

- Robust design - outstanding reliability
- Fewer parts - less maintenance
- Preloaded drive nut - eliminates backlash
- High torque stepper motor (NEMA 17)
- Low cost
- Lengths up to 640 mm
- Ball bearing supports
- Integral screw
- Three (3) leads available

3D models can be downloaded from our website at www.pacific-bearing.com.

NOTE: Other sizes available soon!
Check our website for available sizes.

NOTES: Maximum length for lead screw driven MR is 640mm.
Standard and cut-to-length rail ends are NOT coated. Fully coated rails are available upon request.

PRODUCT OVERVIEW

Based on proven Simplicity® linear bearing technology, Pacific Mechatronics™ Dolphin Guides® contains FrelonGOLD® self-lubricating bearing material. This material results in no metal to metal contact, while dampening vibrations and shock loads. Dolphin Guides® unique two-piece assembly eliminates tolerance stack up and the integrated lightweight packages can drop into existing applications making installation easy.

FEATURES & BENEFITS

- Smooth & Quiet
- Standard lead screw specifications from D075, D100, and D125
- Plug and Play controls available
- Mounting Flexibility - Rails are pre-drilled for mounting ease. The carriage provides side or top mounting.
- Carriage has T-slots & mounting holes
- Drive Options - Choose from ball or lead screws, belt drives, etc. Integrate your own or consult the factory for assistance.
- FrelonGOLD® Liner - 60% less friction, 60% less wear, 100% increased load capacity, 110% increased speed limits, 100% increased PV limits
- Optional brake
- Optional Hand crank
- Clean room compatible
- Corrosion resistant
- Lightweight
- Pre-engineered, ready to use
- No bellows necessary, but are an option
- Contaminated environments, not a problem

Lead screw driven package including motor and drive providing plug-n-play linear motion.

3 Types of Dolphins

- Lead Screw
- Ball Screw
- Pneumatic

TECHNICAL DRAWING

Optional configurations and special carriages are available.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. Precision Positioning

Dolphin Flex Linear Guide - DFG Series

Linear Motion Systems

PRODUCT OVERVIEW

- LaZer Straight™ Rail
- Modular Construction
- Industry Standard Interchange

PATENT PENDING

Note: Not available for sale, resale or distribution in Germany.

Materials:

SimGlide™-E Polymer insert

LaZer Straight™ aluminum rails

Working Temperatures: -40C to 90C (-40F to 195F)

Coefficient of Friction: 0.1- 0.2

Maximum Velocity: 10 m/s (2000 fpm) for intermediate application and 8 m/s (1600 fpm) for continuous application

Maximum PV Value: 10,000 psi - fpm

3D models can be downloaded from our website at www.pacific-bearing.com.

STATIC LOADS WITH NO DRIVE MECHANISM

The numbers below are for guides only in a static condition. The drive mechanism selected (lead screw, ball screw, cylinder, etc.) becomes the limiting factor when calculating maximum load and speed capacities. The user is responsible for determining the maximum capacity for the complete system based on the manufacturer's data for their drive configuration.

Designs must also operate within the following dynamic parameters:

- Maximum Loads (P) = from charts above
- Maximum Speed Dry (V) = 300 ft./min. (1.524 m/s)
- Maximum PV (pressure x velocity) = 20,000 (0.70 N/mm² x m/s)
- PV Example: Load = 85 psi
Speed = 180 ft./min.
PV = 85 x 180 = 15,300 PV

NOTE: FrelonGold® bearing material coefficient of friction is 0.125.

SIZE	F MAX LOAD (lbs.)	F MAX LOAD (N)
D075	500	2,224
D100	750	3,336
D125	1,000	4,448

SIZE	F MAX LOAD (lbs.)	Mx (in./lbs.)	My (in./lbs.)	F MAX LOAD (N)	Mx (Nm)	My (Nm)
D075	250	340	350	1,112	38	40
D100	375	650	730	1,668	73	82
D125	500	1,200	1,225	2,224	136	138

SIZE	F MAX LOAD (lbs.)	F MAX LOAD (N)
D075	125	556
D100	190	845
D125	250	1,112

SIZE	Mx (in./lbs.)	My (in./lbs.)	Mx (Nm)	My (Nm)
D075	340	350	38	40
D100	650	730	73	82
D125	1,200	1,225	136	138

If the drive mechanism (lead screw, ball screw, cylinder, etc.) is centered on the carriage, the load may not exceed a 2:1 ratio to the length of the bearings or binding will occur.

No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

ADJUSTING SLIDE PRELOAD

The preload of a slide should be properly set from the factory, but if you must adjust it yourself, here are some simple steps to follow.

Metric Series

1. To loosen the eccentric (center) roller, use an Allen wrench to loosen the screw that is on the side of the mounting block. Be sure to loosen the screw that is on the side of the direction you want the roller to move.
2. When it is loose, tighten the set screw on the opposite side of the block. This will move the roller and mounting stud.
3. Make a very small change, retighten the first set screw, and try it out. If the preload is too loose, you will feel the slider rock and you will hear a slight "clunk." If it is too tight, the slider will roll rough, like riding a bicycle on a gravel road.
4. Move the slide along the length of the rail by hand. Adjust it so that it does not feel loose anywhere. It may take you several times to get the proper adjustment.
5. Make sure the rollers are tightened with the proper adjustment prior to operation.

SLIDER ORIENTATION

The 3-Roller slide should be installed in the rail so the load is shared on the two outside rollers. The orientation marks indicate how to align the slider with the load direction.

LUBRICATION - RAILS & BEARINGS

The rollers are internally lubricated for life, but the rails must always have a layer of grease. As a guideline, reapply fresh grease every 50,000 cycles.

MOUNTING SLIDER BODY & MAX CAPACITY

Below are recommended bolt tightening torques for mounting to the slide body. Be sure to use bolts that are long enough to obtain full thread engagement.

MOUNTING TORQUES

PART NUMBER	IN-LBS. TORQUE	NM TORQUE

LIFE CALCULATIONS (cont.)

To calculate an approximate life for redi-rail sliders, use the following equation.

Inch Series

The value of L_{RR} is in meters

$$L_{RR} = 10^7 \cdot (Cd / (\text{Load}_{\text{Equiv}} \cdot RF))^{3.0} \text{ (inches)}$$

LC_{RRS} = Slider Life Capacity which is found in the table

$\text{Load}_{\text{Equiv}}$ = Equivalent Radial Load found from the following equation:

$$\text{Load}_{\text{Equiv}} = Cr \cdot \left(\frac{\text{Load}_{\text{Axial}}}{Ca} + \frac{M_x}{M_x \text{ Max}} + \frac{M_y}{M_y \text{ Max}} + \frac{M_z}{M_z \text{ Max}} \right) + \text{Load}_{\text{Radial}}$$

INCH SERIES

PART NUMBER	MAX SPEED (fpm)	MAX SPEED (rpm)	Cd
RRS14	500	6000	421
RRS18	800	9,600	1,032

Metric Series

The value of L_{RR} is in meters

$$L_{RR} = (Cd / \text{Load}_{\text{Equiv}} \cdot RF)^{3.0} \times 100,000 \text{ meters}$$

Cd = Slider Life Capacity which is found in the table

$\text{Load}_{\text{Equiv}}$ = Equivalent Radial Load found from the following equation:

$$\text{Load}_{\text{Equiv}} = Cr \cdot \left(\frac{\text{Load}_{\text{Axial}}}{Ca} + \frac{M_x}{M_x \text{ Max}} + \frac{M_y}{M_y \text{ Max}} + \frac{M_z}{M_z \text{ Max}} \right) + \text{Load}_{\text{Radial}}$$

METRIC SERIES

PART NUMBER	MAX SPEED (m/min)	MAX SPEED (m/s)	Cd (N)
RR30	300	5.0	1,440
RR45	420	7.0	4,404
RR65	480	8.0	10,200

REDUCTION FACTOR

NOTE: Reduction factors apply to both inch and metric series

RF = Reduction Factor of the Application or Environment

- = 1.0 to 1.5 for very clean, low speed (<30% Max), low shocks
- = 1.5 to 2.0 for some dirtiness, moderate speed (30% Max to 75% Max), medium shocks and vibration
- = 2.0 to 3.0 for heavy dirt & dust, high speeds (>75% Max) and heavy shocks & vibrations

LOAD COMPARISON GRAPHS

RRS30

- Integral Seals
- Easy Adjusting

ROLLER/SHAFT INTERFACE

CHARACTERISTICS

- 5.79 Meter Lengths
- Sealed Bearings
- Off Shelf Delivery
- Gothic Arch Rollers
- Solid Roller Mounting

APPLICATIONS

- Automation
- Assembly
- Material Handling
- Packaging

FEATURES

- Slider body is aluminum alloy.
- Maximum temperature approximately 80°C.
- Gothic rollers are 52100 steel, hardened and ground, lubricated for life and sealed against contamination.
- Oil-filled plastic or UHMW spring loaded seals keep contamination clear of the rollers.
- Custom roller configurations can be designed, engineered, and manufactured to meet your specific requirements.
- Patented pre-load adjustment eliminates eccentrics.
- **NEW** coated Redi-Rail FDA compliant, call 800-962-8979 for details.

NOTE: Slide weight .09 Kg

ORDER INFORMATION

EXAMPLE: RRS30U

Redi-Rail Slider size 30 with UHMW seals

- NOTES:** Felt wipers have been replaced by low friction oil impregnated plastic wipers.
No entry in the part # results in use of oil impregnated wiper.

PRODUCT OVERVIEW & APPLICATION

- Strokes range from 500mm to 1250mm
- S shape stainless steel frame ensures heavy duty telescoping application
- Preloaded Redi-Rail assures precision movement
- Follow instructions on how to mount left-handed or right-handed section

Materials: Carbon steel rollers
 300 series stainless steel roller shafts
 300 series stainless steel frame
 Santoprene bumpers
 Anodized aluminum rail
 Stainless steel hardware

300 STAINLESS
 SEALED BEARINGS
 AIRCRAFT ALUMINUM
 HARDENED SHAFTING

Working Temperatures: -20C to 120C (-4F to 248F)

- Oil impregnated wipers not only prevents the system from dust and particle intrusion, but also provide lubrication and extend life cycles.
- Elastomer end stops are not intended as stroke terminus; hard stops must be provided to limit the stroke
- Load rated for a pair of slides when the load is applied on the middle of drawer beams. A load reduction factor shall be used if the load is applied toward the front of drawers.

3D models can be downloaded from our website at www.pacific-bearing.com.

NOTE: Load rated for a pair of slides when the load is applied on the middle of drawer beams. A load reduction factor shall be used if the load is applied toward the front of drawers.

Redi-Rail® Steel Linear Guides

Innovation in Roller-Based Linear Systems

Linear Motion Systems

IMPROVED LOAD CAPACITY

- double row precision ball-bearing rollers
- high load capacity, both radial and axial
- hardened and honed raceways

IMPROVED STIFFNESS

- optimised rail design
- roller bearings preloaded for stiffness

INCREASED SPEED AND LOWER NOISE

- high precision rollers
- super finished raceways
- low noise

EASY ASSEMBLY

- self-aligning and self-adjusting components, compensating for assembly/structural errors

GREAT DESIGN

- innovative and attractive look
- unique black finish

Redi-Rail® Steel Rail

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

IMPROVED LIFE TIME OF ALL COMPONENTS

- innovative materials
- innovative black surface hardening technology
- innovative wear resistance

IMPROVED CORROSION-RESISTANCE

- overall corrosion resistance, due to surface treatment, including raceways
- improved corrosion resistance compared traditional zinc plating

IMPROVED PROTECTION

- dust protection for the entire product range

LOW MAINTENANCE REQUIREMENTS

- self-lubricating system on all sliders and telescopic rails
- rollers lubricated for life

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

SYSTEM LIFE

The actual lifetime of the system (rails, slides, and rollers) depends on the applied load, but is also influenced by factors such as: correct lubrication, environmental conditions, assembly precision to avoid uncalculated component stress/wear and total cycle length.

In order to estimate the expected system lifetime in km of operation, the following equation must be solved:

$$L(Km) = 100 \times (Co/P)^3 \times fc/n \times fa$$

Where:

Co = dynamic load coefficient of roller or slide

P = is the equivalent load applied on the heaviest loaded roller or slide.

For each single roller: $P = P_{rad} + (P_{ax} / Co_{ax}) \times Co_{rad}$

For the slide: $P = P_{rad} + (P_{ax} / Co_{ax} + M_x / Mo_x + M_y / Mo_y + M_z / Mo_z) \times Co_{rad}$

LINEAR PRECISION

The linear precision of the running slide depends on the rail and, specifically, on the longitudinal parallelism between the raceways and precision of the surface to which they are mounted.

As a result, two slide precision values are determined, one referring to the surface the rails is fixed to (A) and the other (B) to the precision of supporting rail.

Precision is achieved when the surfaces are aligned.

When all screws are correctly tightened, the RRT rail aligns with the fixing surface, and this adds up to the construction linear precision of the same rail.

When the RRT-rail is loose, it may result slightly curved.

However, this does not give rise to any problem of alignment, once the rail is properly fixed.

fc = coefficient depending on the actual length of the stroke. This is an important factor in the case of applications with short stroke and high frequency. In these cases total lifetime in km is much shorter, than if application with long strokes. The factor is equal to 1 for stroke longer than 2 meter, while for shorter than 2 meter, the value is derived from the graph shown below:

n = number of slides running on the same rail

fa = coefficient depending on lubrication and environmental conditions. Recommended values are shown in the table below:

fa	APPLICATION CONDITIONS
0.7 - 1	Good lubrication, availability of self-lubricating rail wiper system, no dust accumulation and no pollutants, precise assembly
0.5 - 0.7	Random lubrication, environmental dust, thermal fluctuations, vibrations
0.5 - 0.1	Low lubrication, high environmental pollution, strong thermal fluctuations, high vibrations

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

SIZING CONTROL

When the positioning and configuration of rails and slides or rollers is determined, it is necessary to verify the correct sizing of system components, for both static and dynamic function. With regard to the static verification, it is necessary to determine the load applied onto each single slide. When the heaviest loaded slide is identified, the safety coefficient must be calculated on that slide and the result must be compared with the maximum static load capacity.

When the load applied is the result of a sum of radial and axial loads as well as moments, it is necessary to calculate the value of each component and verify the following:

$$\frac{Pax}{Co\ ax} + \frac{Prad}{Co\ rad} + \frac{Mx}{Mox} + \frac{My}{Moy} + \frac{Mz}{Moz} \leq \frac{1}{Z}$$

For system sizing of Steel Linear Slides, only the axial (Pax) and radial (Prad) load components must be taken into consideration. As a result, it is sufficient to calculate the following:

$$\frac{Pax}{Co\ ax} + \frac{Prad}{Co\ rad} \leq \frac{1}{Z}$$

Where:

Pax = axial load component

Prad = radial load component

Mx, My, Mz = applied moments

Co ax = axial load capacity

Co rad = radial load capacity

Mox, Moy, Moz = resistance capacity to moments

Z = safety coefficient ≥ 1

It is recommended to apply the following values to safety coefficient Z:

Z	APPLICATION CONDITIONS
1 - 1.5	Accurate determination of static and dynamic loads. Precise assembly, tight structure.
1.5 - 2	Average conditions
2 - 3.5	Insufficient determination of applied loads. Vibrations, loose structure. Imprecise assembly. Unfavourable environmental conditions.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

MAINTENANCE

The roller's internal elements are lubricated and protected by double lip seals (2RS). As a result, they are maintenance free.

The sliders of the Steel Linear Guide systems are equipped with lateral seals and a system of strong rail wipers, which incorporate a lubrication system, assuring a release of lubricating oil on the raceways overtime. This gives a maintenance free system for the entire lifetime, under normal clean operational environment.

A similar rail wiper and lubrication system is also standard assembled on the entire system of Drawer Slides of the Precision/RDR series.

In case the wipers with integrated lubrication system is disassembled, it is necessary to provide a periodic manual lubrication of the raceways, to assure a sufficient lubrication on the contact areas. In addition, it is also necessary to regularly clean the raceways for impurities or other residues.

For lubrication we recommend to apply standard lithium grease lubrication, specific for ball bearings.

CORROSION RESISTANCE

All Steel and Flexible rails have a surface treatment, which ensures the hardness and offers a high resistance to corrosion. As the surface treatment is carried out after working the raceways, the complete surface has a high corrosion protection also on the raceways. The treatment gives the rails an overall black finish.

In comparison to traditional electrolytic galvanization zinc plating, this surface treatment offer a much better corrosion resistance protection of the rails, which usually are more exposed to corrosion than the sliders.

All sliders and intermediate plate in RDR drawer slides have an electrolytic zinc plating surface treatment.

ADDITIONAL TECHNICAL INFORMATION

Any further technical product information or questions about their correct installation, may be requested from our Application Engineers.

RSS43 & RRT43

APPLICATIONS

RAIL WITH FLOATING SLIDE RP SERIES

FLOATING SLIDE RP SERIES

The "Floating" slides contain only floating rollers, three or five in total. The contact areas with the raceways only provide for radial load and M_z capacities, thus allowing for axial movement and a simultaneous slight rotation of the slide to offer axial and longitudinal compensation, while maintaining original preload and same precise and smooth straightline movement.

ROTATING SLIDE RA SERIES

The "Rotating" slides are mounted with two or three guiding V-rollers (depending if slide has 3 or 5 rollers in total), which are aligned against the same lower raceway for max. radial load capacity. While one or two (depending if slide has three or five rollers in total) floating P rollers are mounted against the upper raceway. This configuration allows the A slide a minor rotation, around the contact points of the lower raceway. This compensates for axial misalignment, while maintaining its original preload and same straight, precision motion.

LONGITUDINAL PARALLELISM ERROR

PRODUCT OVERVIEW

The Redi-Rail® Precision Drawer Slides & Redi-Rail® Compact Precision Drawer Slides systems are the world's only telescopic rail system for complete extension, based on precision rollers and hardened raceways and with incorporate self-aligning feature (RDR series).

The system offers unique possibilities for all kinds of automation applications, where smooth and precise telescopic movement is required. Optimal movement with no play for High-Tech telescopic applications, or for even heavy load and high frequency applications.

To guarantee high load capacities and low deflexion, the RDR drawer slides are fixed to an intermediate S-shaped steel plate.

The RDQ drawer slides have the RRT-rails functioning as the intermediate element, offering good radial and axial load capacities, with very compact overall dimensions.

the RDR and RDQ rails are the only drawer slide system which incorporates self-aligning feature to absorb parallelism errors of the mounting surfaces.

The Precision and Compact Precision systems are composed of exactly the same components as the Redi-Rail® Steel Rail system, except that the slider bodies are different, as longer and with more rollers. All drawer slides feature strong raceway wipers and greasing system for low maintenance.

The RDR drawer slides offer unique self-aligning capability, when used in pair. As the right telescopic rail RDRD, allows the sliders to rotate in the lower rail-element, to compensate assembling or surface misalignment errors, while maintaining the same precise, preloaded extension.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

PRODUCT OVERVIEW

The RDR Redi-Rail® Precision Drawer Slides are designed for heavy duty High-Tech telescopic applications, with precise motorized movement, requiring constant smooth sliding performance with no play.

The special smooth operating performance is due to double-row precision bearings strong rails with hardened and honed raceways, fixed to a rigid intermediate S-shaped steel plate, assuring high load capacities and low deflexion at even fully extended position.

The PBC drawer slides assure unique self-aligning capability, when used in pairs.

The right drawer slide RDRD, allows the slides to rotate with no play, in the lower rail-element to compensate for surface misalignments, while the rigid left RDRS drawer slide, maintains a stable and precise extension. The RDR or Redi-Rail® Precision drawer slide system offers unique

possibilities and benefits for all kind of automation applications with variable telescopic strokes, which until now have been troubled by common friction and breakdown problems, during the ball-cage rephasing when using of old-type ball-cage drawer slides. To assure maximum load

capacity the drawer slides must be correctly positioned according to the rollers' positioning, which are non-symmetric and with different position in upper – lower rail element.

Therefore the extended part must always be fixed to the lower rail. All Redi-Rail® Drawer Slides guarantee maintenance free operation, thanks to strong raceway wipers and longitudinal seals for dust and impurity protection, and an integrated lube for-life greasing system, assuring a constant thin layer of lubrication on the raceway surfaces.

All Redi-Rail® Precision Drawer Slides are equipped with internal end-stops, only designed to drag the intermediate element. It is therefore highly recommended not to use these internal ends- of stroke travel limits as functional terminals; strong external end-stops must be added. The Redi-Rail®

Precision Drawer Slides load capacities are intended at half extension (L/2) as indicated in by letter "P" in below drawing. Unlike ball-cages drawer slides, the Redi-Rail® Drawer Slides maximum load capacities are based on continuously non-stop operation.

Therefore a straight load comparison with other drawer slides isn't possible, as these load capacities are merely a static load capacity, based on low daily frequency. To offer a wide range of load capacities and extensions, the Redi-Rail® Drawer Slides come in 2 dimensions. The RDR80, based on 28mm rails with outer height of 80mm and RDR116, based on 43mm rails, with outer height of 116mm. Both rails come with an overall black finish.

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. However, it is the responsibility of the user to determine and ensure the suitability of Pacific Bearing® products for a specific application. Pacific Bearing's only obligation will be to repair or replace without charge, any defective components if returned promptly. No liability is assumed beyond such replacement. *Consult www.pacific-bearing.com for the latest technical updates.

PRODUCT OVERVIEW

The very compact RDO drawer slides are designed for High-Tech telescopic applications with precise motorized movement, requiring constant smooth sliding performance with no play.

The squared design is obtained by using two RRT-rails with hardened honed raceways, as the rigid intermediate element, into which the slides are assembled. The RDO drawer slides offer both high radial and axial load capacities.

The rail/slide configuration allows the RDO drawer slides to be mounted not only at the side, but also underneath the moving part, when there are space limitations at the sides, or to be used in typical vertical applications. See below tables and figures.

In the case of horizontal panel extension, we recommend the use of a pair of RDR and RDO, as the RDR can absorb some lateral structural misalignments on the vertical axis.

RDO system assures smooth extension for all kinds of automation applications with variable telescopic strokes, which until now have been troubled by common friction breakdown problems, during the ball-cage rephasing, when using typical drawer slides. Same rephase problem or even deformation of the ball-cages, occurs for all vertical applications, as the ball-cage in such drawer slides, constantly tend to move downwards, so extra friction is generated with each stroke, during the repositioning of the ball-cages.

To assure maximum load capacity the drawer slides must be correctly orientation, assembled. The extended part must always be fixed to the shortest slide.

All Redi-Rail® Steel Rails guarantee maintenance free operation, thanks to strong raceway wipers and longitudinal seals for dust and impurity protection, and an integrated lubed for-life greasing system, assuring a constant thin layer of lubrication on the raceway surfaces.

All Redi-Rail® Compact Precision Drawer Slides are equipped with internal end-stops, only designed to drag the intermediate element. It is therefore highly recommended not to use these internal end of stroke travel limits as functional terminals; strong external end-stops must be added. Similarly to the RDR series, the RDO's stroke goes slightly beyond the overall length of the rail in closed position. The rails come with an overall black finish.

PRODUCT OVERVIEW

Redi-Rail® V-Guide System components provide an excellent alternative for linear motion applications in harsh environments with medium accuracy requirements, and high speed capabilities.

FEATURES & BENEFITS

Redi-Rail V-Guide systems are an industry standard for linear motion, and offer features that make them an ideal solution for a wide range of motion control applications.

V-Guide System:

- Excellent for harsh environments
- High speed capabilities
- Low noise operation

V-Guide Rail:

- Has shoulder for simple mounting and alignment
- Available in long lengths
- Induction hardened way surface

V-Guide Wheels:

- Permanently lubricated
- Precision dual row bearing construction
- Available in 52100 Bearing Steel or 440 Stainless Steel construction

Wheel Bushings:

- 303 Stainless Steel
- Available for English or metric hardware

APPLICATIONS

- Machine tool doors
- Vending machines
- Woodworking machinery
- Carpet and textile machinery
- Laboratory automation
- Paper converting equipment
- Packaging machinery

TECHNICAL SPECIFICATIONS

Linear Bearing for Axial & Radial Loads

Wheels:

Redi-Rail V-Guide Wheels are precision ground dual row angular contact ball bearings with hardened outer way surfaces that provide low friction guidance for linear motion applications. V-Guide wheels can be used with internal or external 90-degree ways, or used with round shafts.

- Available in four sizes
- 52100 Bearing Steel or 440 Stainless Steel construction
- Permanently grease lubricated
- Available with 304 Stainless Steel shields, or nitrile rubber seals

Rails:

Redi-Rail V-Rails are available in four sizes, which are designed for the corresponding size wheels. The V-Ways are induction hardened and polished, while the track body is left soft for easy drilling of mounting holes.

- Available in 1045 Carbon Steel or 400 Stainless Steel
- Optional black oxide finish
- Choose predrilled rail from stock, or custom cut and drilled to your specification

Bushings:

Bushings allow for the wheels to be mounted with the appropriate fastener for the specific application.

- Fixed bushings are used in the primary radial load direction
- Adjustable bushings allow adjustable fit and preload
- Stainless Steel construction

LOAD CALCULATIONS

L = applied load / number of wheel pairs

L_R = wheel radial load

L_0 = wheel load from moment

A = load offset dimension

B = track width dimension

$F_A = .5$ for light duty, well lubricated use

$F_A = 1$ for normal lubricated use

$F_A = 2$ for dry, or harsh environments

LOAD CONDITION A

$$L_{01} = \frac{L \times (B - A)}{B} \times F_A$$

$$L_{02} = (L \times F_A) - L_{01}$$

Compare the greater of these loads to the rated moment and radial load capacities.

Example:

Load is 100 lbs on 4 wheel carriage,

$L = 100 / 2$ pair wheels = 50 lbs.

$A = 4"$, $B = 10"$, $F_A = 1$

$$L_{01} = \frac{50 \times (10 - 4)}{10} \times 1 = 30 \text{ lbs.}$$

$$L_{02} = 50 - 30 = 20 \text{ lbs.}$$

LOAD CONDITION B

$$L_{01} = \frac{L \times A}{B} \times F_A$$

$$L_{02} = (L \times F_A) + L_{01}$$

Compare the greater of these loads to the rated moment and radial load capacities.

Example:

Load is 100 lbs. on 4 wheel carriage,

$L = 100 / 2$ pair wheels = 50 lbs.

$A = 4"$, $B = 6"$, $F_A = 1$

$$L_{01} = \frac{50 \times 4 \times 1}{6} = 33 \text{ lbs.}$$

$$L_{02} = 50 + 33 = 83 \text{ lbs.}$$

LOAD CONDITION C

$$L_{01} = \frac{L \times A}{B} \times F_A$$

$$L_R = (L \times F_A) + L_{01}$$

$$L_{01} = L_{02}$$

Compare the greater of these loads to the rated moment and radial load capacities.

Example:

Load is 100 lbs. on 4 wheel carriage,

$L = 100 / 2$ pair wheels = 50 lbs.

$A = 4"$, $B = 6"$, $F_A = 1$

$$L_{01} = \frac{50 \times 4 \times 1}{6} = 33 \text{ lbs.}$$

$$L_R = (50 \times 1) + 33 = 83 \text{ lbs.}$$

MOUNTING AND ADJUSTMENT

Use the recommended fasteners for the specified track and wheel bushings.

Use the following table, and the center distance formulas in the next column, to configure the appropriate wheel mounting dimensions.

V-RAIL SIZE	IV (in.)	OV (in.)	IV (mm)	OV (mm)
1	0.874	0.934	22.2	23.7
2	1.374	1.436	34.9	36.5
3	2	2.124	50.8	53.9
4	2.624	2.75	66.6	69.9

The fixed bushing should be used to carry the heaviest loading. Preload the adjustable bushing so that the wheel can just be turned by hand. Over-tightening the preload will cause premature wear of the components.

LUBRICATION

The V-Guide wheels are grease lubricated, and will not require any additional lube. The track should be lubricated for optimum performance and service life. Suggested lubricants are Mobil Vactra #2 Way Oil, or Mobil Polyrex EP 2 Extreme Pressure Grease.

PRODUCT OVERVIEW

The Redi-Rail® Commercial Rail is a simple and cost effective linear motion solution with high load capacity and corrosion resistance. The Commercial Rail is used in various applications such as: Automation, packaging, material handling, environmental, energy, HVAC, medical, office equipment and many others.

FEATURES

- Roll formed rails made of steel/stainless steel sheet for low cost and corrosion resistance application
- Zinc plated rail length up to 6000mm
- Machined slider body made of aluminum alloy and anodized for corrosion resistance
- Steel rollers are made of 52100 chrome steel, hardened and ground, lubricated for life and sealed against contamination
- Stainless steel rollers made of 440C stainless steel for better corrosion resistance, lubricated for life and sealed against contamination
- Rollers made with thread integrated inner ring for ease of assembly and adjustment of pre-load
- Custom polymer wipers can be designed and manufactured to improve the smoothness of motion and service life
- Maximum operating temperature 100°C or 212°F
- Consult with factory for special hole spacing
- Speed up to 1.5 m/s
- Moment loads should be carried by two slides or two parallel rollers

APPLICATIONS

- Automation
- Packaging, material handling, etc
- Environmental, energy, HVAC, etc.
- Medical
- Office equipment

SLIDE ORIENTATION

The 3-roller slide should be installed in the rail so that the load is shared among the two outside rollers. The orientation marks indicate how to align the slider with the load direction

LUBRICATION – RAILS & BEARINGS

The rollers are internally lubricated for life, but the rails must always have a layer of grease. As a guideline, reapply fresh grease every 50,000 cycles.

PRELOAD ADJUSTMENT

- To loosen the center roller, use an Allen wrench to un-tighten the screw while holding the roller still with an open-end wrench
- Turn the center roller to a position to achieve the desired pre-load
- Move the slide along the length of the rail by hand. Adjust it so that it does not feel loose anywhere.
- Tighten the screw while holding the roller flat with an open-end wrench

Redi-Rail® Hardened Crown Rollers

Linear Motion Systems

- Low cost linear motion solution
- Precision rolling element bearing riding in a Unistrut™ type rail
- 9/16" Hex head for easier mounting
- Simple solution and setup for point-to-point applications
- Hardened crown provides self-alignment, good strength, and long life
- MAX. bearing load - 300 lbs.
- MAX. bearing speed - 150 ft./ min. (30 in./sec.)
- Rails available in lengths up to 10'

RAILS AVAILABLE WITH TWO FINISHES:

- Bare steel
- Powder coated

ACCESSORIES AVAILABLE:

- Angle brackets (for welding to mounting rail)
- End stops

™ Unistrut is a trademark of Unistrut, Inc.

ORDERING INFORMATION

The Hevi-Rail® high load capacity linear bearing guide systems from Pacific Bearing provide high axial and radial load capacity for material handling, packaging, automotive, aerospace, steel, paper processing and many more industries and applications with medium to low precision requirements.

FEATURES & BENEFITS

The economical Hevi-Rail® guide systems offer a lifetime of durability under continuous use. The easily interchangeable bearing components provide even dispersion of forces in the profile rails for longer system life and stability.

Linear Bearings:

- Outer ring made of case-hardened steel
- Handles very high axial and radial loads
- Easily interchangeable components for less down-time

Profile Rails:

- Standard length up to 6 meters
- Available sand blasted and lightly oiled
- U-channel and I-channel available

Flange Plates:

- Simple mounting for bearings
- Can be ordered pre-welded to bearing

Ordering example: HVB-054/HVPO-1

Clamp Flanges:

- Adjustable
- Eliminates need for welding and straightening
- Easily adjustable parallelism

APPLICATIONS

Some application examples:

- Telescoping applications (ex. overhead extending jib crane)
- Warehouse handling systems / other material handling
- Custom and standard lift units
- Large Shrink-wrap machinery
- Steel and coil handling
- Large variety of material handling

TECHNICAL SPECIFICATIONS

Linear Bearing for Axial & Radial Loads

Prior to welding, disassemble bearing components. To avoid cracks in welded joints, please use welding electrodes and core weld for unalloyed steel.

Materials:

Outer ring - Case-hardened steel UNI 20 MnCr 5 hardened at 60+2 HRC

Inner ring - Hardened steel En 31 - SAE 52100 hardened at 62-2 HRC

Cylindrical rollers - Flat ground heads are hardened steel, En 31 - SAE 52100, hardened at 59-64 HRC

Welding bolts - Low carbon steel

Bolt tolerance = 0.05 mm

Seals:

Bearings with fixed axial bearing (HVB-053 to HVB-063) - radial bearing has steel labyrinth and side guide roller with rubber seals

Bearings with eccentric adjustable axial bearing (HVBEA-454 to HVBEA-463) - Both radial and axial bearings utilize rubber seals (RS type)

Lubrication:

Bearings are supplied lubricated with grease grade 3. Bearings from HVB-055 to HVB-063 can be relubricated with grease zerk. Adjustable bearings are not available with zerk.

Temperature: Resistant from -10°C to 80°C (14°F to 176°F)

Adjusting Axial Bearing (HVBEA-454 to HVBEA-463)

1. Remove front screws. Heat or tap sharply to break Loctite®.
2. Rotate axial bearing shaft
3. Check dimension A (repeat step 2, if needed)
4. Re-install front screws with Loctite®

The data and specifications in this publication have been carefully compiled and are believed to be accurate and correct. CALCULATION OF FMAX FOR CANTILEVERED LOADS

Q = Load capacity (N)

L = Load distance to suspension point (mm)

P = Suspension point

A = Bearing distance (mm) recommended 500–1000 mm

$$\text{Formula: } F_{\text{max stat radial}} = \frac{Q \cdot L}{2 \cdot A}$$

To avoid wearout in the rail, which is not hardened, the pressure between bearing and rail should be max.

$P_{\text{zul}} = 860 \text{ N/mm}^2$ for Profile Rails HVB-0 to HVB-6.

$P_{\text{zul}} = 750 \text{ N/mm}^2$ for all profile rails. Indicated here are

$F_{\text{max stat radial}} + \text{axial}$ for each bearing.

POSSIBLE MOUNTING CONFIGURATIONS

LIFTING UNITS

HORIZONTAL TELESCOPE

ADJUSTABLE CLAMP SYSTEM

HANDLING UNITS

SYSTEM DESIGN SUGGESTIONS

1. The overall system clearance should be 1.524 mm to 3.048 mm

2. Verify that the Axial bearing is aligned parallel to the rail; especially in vertical operations.

Inner Rail Distance = Saddle Width + (1.524 mm to 3.048 mm)

PACIFIC BEARING'S INNOVATIVE PRODUCT LINE-UP

Self-lubricating Linear Plane Bearings with engineered-to-match steel and ceramic coated shafting, pillow blocks, pre-drilled support rails, and integrated 1-piece rail and shaft.

- No lubrication required
- Tolerates temperature extremes
- Cannot catastrophically fail
- Fully interchangeable

simplicity®

Self-lubricating miniature linear guides

- Fully size interchangeable with industry standard sizes
- Lengths up to 3600 mm (12 ft.)
- No lubrication required
- Tolerates temperature extremes

mini-rail®

Combination axial and radial load heavy-duty rolling element bearings and rails

- Extremely High Load capacity up to 4.6 US Ton-force
- Longer service life for bearings and profiles
- Unlimited rail lengths available

Hevi-Rail®
Heavy Duty Bearing Systems

Rolling element linear guides, belt driven systems, drawer slides, and V-Guide Systems

- Cost effective solution for long travel and harsh environment applications
- Precision tolerances +/- .025 mm over entire rail length
- Simple design for fast, easy installation
- Lightweight, durable construction

redi-rail®

Self-lubricating guide systems

- Dampens vibration & shock loads
- Customize with ball or lead screws, belt drives & more
- No lubrication required
- Tolerates temperature extremes

dolphin guides®

An entrepreneurial mechanical engineer, Bob Schroeder, founded Pacific Bearing in 1983 with Simplicity®, the world's first self-lubricating plane bearing. Mr. Schroeder's vision was then, and still is today, to simplify linear motion applications and reduce costs for industrial motion control consumers worldwide. This ideal has been realized and embraced today by Pacific Bearing's employees that engineer, manufacture, market and sell innovative linear guide systems and components. In addition, Pacific Bearing has over 1,200 distributors and sales agents worldwide.
